### Solution overview

The AXIS Q87 Bispectral PTZ Network Camera is intended for mission-critical surveillance that demands 24-hour monitoring of restricted areas, such as airports.

In difficult lighting conditions, the thermal channel can detect objects (1) that the visual channel can't. To take advantage of this, you can set up the thermal channel to automatically detect motion, and send a signal to the visual channel to zoom in and record. To find out more, go to .

The camera (2) is often installed in inaccessible locations. With the built-in wiper and optional washer you can remove, for example, sea salt from the front window without physically accessing the camera. To find out more, go to .

Thanks to the wide tilt range you can, for example, detect various flying objects (3).

## Get started

### Find the device on the network

To find Axis devices on the network and assign them IP addresses in Windows®, use AXIS IP Utility or AXIS Device Manager. Both applications are free and can be downloaded from [axis.com/support](https://axis.com/support).

For more information about how to find and assign IP addresses, go to *How to assign an IP address and access your device*.

### Browser support

You can use the device with the following browsers:

	Chrome™	Edge™	Firefox®	Safari®
Windows®	✓	✓	*	*
macOS®	✓	✓	*	*
Linux®	✓	✓	*	*
Other operating systems	*	*	*	*

✓: Recommended

\*: Supported with limitations

### Open the device's web interface

1. Open a browser and type the IP address or host name of the Axis device.  
If you do not know the IP address, use AXIS IP Utility or AXIS Device Manager to find the device on the network.
2. Type the username and password. If you access the device for the first time, you must create an administrator account. See .

For descriptions of all the controls and options in the device's web interface, see .

### Create an administrator account

The first time you log in to your device, you must create an administrator account.

1. Enter a username.
2. Enter a password. See .
3. Re-enter the password.
4. Accept the license agreement.
5. Click **Add account**.

#### Important

The device has no default account. If you lose the password for your administrator account, you must reset the device. See .

## **Secure passwords**

### **Important**

Use HTTPS (which is enabled by default) to set your password or other sensitive configurations over the network. HTTPS enables secure and encrypted network connections, thereby protecting sensitive data, such as passwords.

The device password is the primary protection for your data and services. Axis devices do not impose a password policy as they may be used in various types of installations.

To protect your data we strongly recommend that you:

- Use a password with at least 8 characters, preferably created by a password generator.
- Don't expose the password.
- Change the password at a recurring interval, at least once a year.

## **Make sure that no one has tampered with the device software**

To make sure that the device has its original AXIS OS, or to take full control of the device after a security attack:

1. Reset to factory default settings. See .  
After the reset, secure boot guarantees the state of the device.
2. Configure and install the device.

## **Web interface overview**

This video gives you an overview of the device's web interface.

*Axis device web interface*

## Configure your device

### Basic settings

#### Set the capture mode

1. Go to **Video > Installation > Capture mode**.
2. Click **Change**.
3. Select a capture mode and click **Save and restart**.  
See also .

#### Set the power line frequency

1. Go to **Video > Installation > Power line frequency**.
2. Click **Change**.
3. Select a power line frequency and click **Save and restart**.

### Adjust the image

This section includes instructions about configuring your device. If you want to learn more about how certain features work, go to .

#### Level the camera

To adjust the view in relation to a reference area or an object, use the level grid in combination with a mechanical adjustment of the camera.

1. Go to **Video > Image >** and click  **A**.
2. Click  to show the level grid.
3. Adjust the camera mechanically until the position of the reference area or the object is aligned with the level grid.

#### Adjust the focus faster with focus recall areas

To save the focus settings at a specific pan/tilt range, add a focus recall area. Each time the camera moves into that area it recalls the previously saved focus. It's enough to cover half of the focus recall area in the live view.

We recommend the focus recall feature in the following scenarios:

- When there is a lot of manual operation in live view, for example with a joystick.
- Where PTZ preset positions with manual focus are not efficient, for example movements where the focus setting changes continuously.
- In low-light scenarios, where the autofocus is challenged by the lighting conditions.

#### Important

- The focus recall overrides the camera's autofocus at the specific pan/tilt range.
- A preset position overrides the focus setting saved in the focus recall area.
- The maximum number of focus recall areas is 20.

#### Create a focus recall area

1. Pan, tilt, and zoom into the area where you would like to have focus.

As long as the focus recall button shows a plus , you can add a focus recall area in that position.

2. Adjust the focus.
3. Click the focus recall button.

### Delete a focus recall area

1. Pan, tilt, and zoom into the focus recall area you want to delete.

The focus recall button toggles to minus when the camera detects a focus recall area:

2. Click the focus recall button.

### Select scene profile

A scene profile is a set of predefined image appearance settings including color level, brightness, sharpness, contrast and local contrast. Scene profiles are preconfigured in the product for quick setup to a specific scenario, for example **Forensic** which is optimized for surveillance conditions. For a description of each available setting, see .

You can select a scene profile during the initial setup of the camera. You can also select or change scene profile later.

1. Go to **Video > Image > Appearance**.
2. Go to **Scene profile** and select a profile.

### Reduce image processing time with low latency mode

You can optimize the image processing time of your live stream by turning on low latency mode. The latency in your live stream is reduced to a minimum. When you use low latency mode, the image quality is lower than usual.

1. Go to **System > Plain config**.
2. Select **ImageSource** from the drop-down list.
3. Go to **ImageSource/I0/Sensor > Low latency mode** and select **On**.
4. Click **Save**.

### Select exposure mode

#### Note

Exposure modes are only available for the visual channel.

To improve image quality for specific surveillance scenes, use exposure modes. Exposure modes lets you control aperture, shutter speed, and gain. Go to **Video > Image > Exposure** and select between the following exposure modes:

- For most use cases, select **Automatic** exposure.
- For environments with certain artificial lighting, for example fluorescent lighting, select **Flicker-free**. Select the same frequency as the power line frequency.
- For environments with certain artificial light and bright light, for example outdoors with fluorescent lighting at night and sun during daytime, select **Flicker-reduced**. Select the same frequency as the power line frequency.

### Benefit from IR light in low-light conditions by using night mode

Your camera uses visible light to deliver color images during the day. But as the visible light diminishes, color images become less bright and clear. If you switch to night mode when this happens, the camera uses both visible and near-infrared light to deliver bright and detailed black-and-white images instead. You can set the camera to switch to night mode automatically.

1. Go to **Video > Image > Day-night mode**, and make sure that the **IR-cut filter** is set to **Auto**.

## Reduce noise in low-light conditions

### Note

Low-light settings are only available for the visual channel.

To reduce noise in low-light conditions, you can adjust one or more of the following settings:

- Adjust the trade-off between noise and motion blur. Go to **Video > Image > Exposure** and move the **Blur-noise trade-off** slider toward **Low noise**.
- Set the exposure mode to automatic.

### Note

A high max shutter value can result in motion blur.

- To slow down the shutter speed, set max shutter to the highest possible value.
- If there is an **Aperture** slider, move it towards **Open**.

## Maximize the details in an image

### Important

If you maximize the details in an image, the bitrate will probably increase and you might get a reduced frame rate.

- Go to **Video > Stream > General** and set the compression as low as possible.
- Below the live view image, click  and in **Video format**, select **MJPEG**.
- Go to **Video > Stream > Zipstream** and select **Off**.

## Handle scenes with strong backlight

Dynamic range is the difference in light levels in an image. In some cases the difference between the darkest and the brightest areas can be significant. The result is often an image where either the dark or the bright areas are visible. Wide dynamic range (WDR) makes both dark and bright areas of the image visible.

1. Go to **Video > Image > Wide dynamic range**.
2. If you still have problems, go to **Exposure** and adjust the **Exposure zone** to cover the area of interest.

Find out more about WDR and how to use it at [axis.com/web-articles/wdr](http://axis.com/web-articles/wdr).

## Stabilize a shaky image with image stabilization

Image stabilization is suitable in environments where the product is mounted in an exposed location where vibrations can occur, for example, due to wind or passing traffic.

The feature makes the image smoother, steadier, and less blurry. It also reduces the file size of the compressed image and lowers the bitrate of the video stream.

### Note

When you turn on image stabilization, the image is slightly cropped, which lowers the maximum resolution.

1. Go to **Video > Installation > Image correction**.
2. Turn on **Image stabilization**.

## Hide parts of the image with privacy masks

You can create one or several privacy masks to hide parts of the image.

1. Go to **Video > Privacy masks**.
2. Click .

3. Click the new mask and type a name.
4. Adjust the size and placement of the privacy mask according to your needs.
5. To change the color for all privacy masks, click **Privacy masks** and select a color.

See also

### Show an image overlay

You can add an image as an overlay in the video stream.

1. Go to **Video > Overlays**.
2. Click **Manage images**.
3. Upload or drag and drop an image.
4. Click **Upload**.
5. Select **Image** from the drop-down list and click .
6. Select the image and a position. You can also drag the overlay image in the live view to change the position.

### Show a text overlay

You can add a text field as an overlay in the video stream. This is useful for example when you want to display the date, time or a company name in the video stream.

1. Go to **Video > Overlays**.
2. Select **Text** and click .
3. Type the text you want to display, or select modifiers to show for example the current date.
4. Select a position. You can also click-and-drag the overlay in the live view to change the position.

### Show the pan or tilt position as a text overlay

You can show the pan or tilt position as an overlay in the image.

1. Go to **Video > Overlays** and click .
2. In the text field, type #x to show the pan position.  
Type #y to show the tilt position.
3. Choose appearance, text size, and alignment.
4. The current pan and tilt positions show up in the live view image and in the recording.

### Add street names and compass direction to the image

#### Note

The preset positions and compass direction will be visible in the compass field in all video streams and recordings.

To activate the compass:

1. Go to **PTZ > Orientation aid**.
2. Turn on **Orientation aid**.
3. Position the camera view at north with the crosshair. Click **Set north**.

To add a preset position to show in the compass field:

1. Go to **PTZ > Preset positions**.

2. Use the crosshair to position the view where you want to add a preset position.
3. Click  Add preset position to create a new preset position.

## **Adjust the camera view (PTZ)**

### **Limit the pan, tilt, and zoom movements**

If there are parts of the scene that you don't want the camera to reach, you can limit the pan, tilt, and zoom movements. For example, you want to protect the privacy of residents in an apartment building, which is located close to a parking lot that you intend to monitor.

To limit the movements:

1. Go to **PTZ > Limits**.
2. Set the limits as needed.

### **Create a guard tour with preset positions**

A guard tour displays the video stream from different preset positions either in a predetermined or random order, and for configurable periods of time.

1. Go to **PTZ > Guard tours**.
2. Click  Guard tour.
3. Select **Preset position** and click **Create**.
4. Under **General settings**:
  - Enter a name for the guard tour and specify the pause length between each tour.
  - If you want the guard tour to go to the preset positions in a random order, turn on **Play guard tour in random order**.
5. Under **Step settings**:
  - Set the duration for the preset.
  - Set the move speed, which controls how fast to move to the next preset.
6. Go to **Preset positions**.
  - 6.1. Select the preset positions that you want in your guard tour.
  - 6.2. Drag them to the **View order** area, and click **Done**.
7. To schedule the guard tour, go to **System > Events**.

## **View and record video**

This section includes instructions about configuring your device. To learn more about how streaming and storage works, go to .

### **Reduce bandwidth and storage**

#### **Important**

Reducing the bandwidth can lead to loss of detail in the image.

1. Go to **Video > Stream**.
2. Click  in the live view.
3. Select **Video format AV1** if your device supports it. Otherwise select **H.264**.
4. Go to **Video > Stream > General** and increase **Compression**.

5. Go to **Video > Stream > Zipstream** and do one or more of the following:

**Note**

The **Zipstream** settings are used for all video encodings except MJPEG.

- Select the **Zipstream Strength** that you want to use.
- Turn on **Optimize for storage**. This can only be used if the video management software supports B-frames.
- Turn on **Dynamic FPS**.
- Turn on **Dynamic GOP** and set a high **Upper limit GOP length** value.

**Note**

Most web browsers don't support H.265 decoding and because of this the device doesn't support it in its web interface. Instead you can use a video management system or application that supports H.265 decoding.

## Set up network storage

To store recordings on the network, you need to set up your network storage.

1. Go to **System > Storage**.
2. Click  **Add network storage** under **Network storage**.
3. Type the IP address of the host server.
4. Type the name of the shared location on the host server under **Network share**.
5. Type the username and password.
6. Select the SMB version or leave it on **Auto**.
7. Select **Add share without testing** if you experience temporary connection issues, or if the share is not yet configured.
8. Click **Add**.

## Record and watch video

Record video directly from the camera

1. Go to **Video > Stream**.
2. To start a recording, click .

If you haven't set up any storage, click  and . For instructions on how to set up network storage, see

3. To stop recording, click  again.

Watch video

1. Go to **Recordings**.
2. Click  for your recording in the list.

## Set up rules for events

You can create rules to make your device perform an action when certain events occur. A rule consists of conditions and actions. The conditions can be used to trigger the actions. For example, the device can start a recording or send an email when it detects motion, or show an overlay text while the device is recording.

To learn more, see *Get started with rules for events*.

## Trigger an action

1. Go to **System > Events** and add a rule. The rule defines when the device will perform certain actions. You can set up rules as scheduled, recurring, or manually triggered.
2. Enter a **Name**.
3. Select the **Condition** that must be met to trigger the action. If you specify more than one condition for the rule, all of the conditions must be met to trigger the action.
4. Select which **Action** to perform when the conditions are met.

### Note

- If you make changes to an active rule, the rule must be turned on again for the changes to take effect.

## Detect motion with the thermal channel and zoom in and record with the visual channel

In difficult lighting conditions the thermal channel can detect objects that the visual sensor can't. This example explains how to use the thermal channel to detect motion, and then use the visual channel to zoom in and record. In the example, the camera monitors a gate.

### Create a motion detection profile:

#### Note

If you run AXIS Motion Guard on both channels simultaneously, it can affect the frame rate and the general performance. Therefore, we recommend you to remove all AXIS Motion Guard profiles on the visual channel.

1. Go to **Apps** and open **AXIS Video Motion Detection**.
2. Select **Thermal**.
3. Create a profile named *Gate profile* that covers the area of interest. Find out more in the user manual for AXIS Motion Guard at [axis.com/products/online-manual/](http://axis.com/products/online-manual/).

### Create the preset positions:

1. Go to **PTZ > Preset positions**.  
Both channels share the same preset configurations.
2. Create the home position that includes the area of interest.
3. Create a zoomed-in preset position, called *Gate position*, that covers the area in the image where you predict that the moving object will appear.

### Create a rule to zoom in with the visual channel when the thermal channel detects motion:

1. Go to **System > Events** and add a rule.
2. Name the rule *Gatekeeper*.
3. In the list of conditions, under **Applications**, select **Motion Guard: Gate profile (Thermal)**.
4. In the list of actions, under **Preset positions**, select **Go to preset position**.
5. Under **Video channel**, select **Camera 1**.
6. Under **Preset position**, select **Gate position**.
7. Select **Home timeout** and set the duration for the camera to stay in the gate position (wait at least 30 seconds before returning to home position).
8. Click **Save**.

### Create a rule to record video to the SD card:

1. Create a rule and name it *Record video*.
2. In the list of conditions, under **PTZ**, select **PTZ preset position reached: Camera 1**.
3. Under **Preset position**, select **Gate position**.
4. In the list of actions, under **Recordings**, select **Record video while the rule is active**.
5. Under **Camera**, select **Camera 1**.

6. Under **Storage**, select **SD card**.
7. Click **Save**.

## Audio

### Add audio to your recording

Turn on audio:

1. Go to **Video > Stream > Audio** and include audio.
2. If the device has more than one input source, select the correct one in **Source**.
3. Go to **Audio > Device settings** and turn on the correct input source.
4. If you make any changes to the input source, click **Apply changes**.

Edit the stream profile that is used for the recording:

5. Go to **System > Stream profiles** and select the stream profile.
6. Select **Include audio** and turn it on.
7. Click **Save**.

### Add audio capability to your product using portcast

With portcast technology, you can add audio capability to your product. It allows audio and I/O communication digitally over the network cable between the camera and the interface.

To add audio capability to your Axis network video device, connect the portcast compatible Axis audio device and I/O Interface between your device and the PoE switch which provides power.

1. Connect the Axis network video device (1) and the Axis portcast device (2) with a PoE cable.
2. Connect the Axis portcast device (2) and the PoE switch (3) with a PoE cable.

- 1 Axis network video device
- 2 Axis portcast device
- 3 Switch

Once the devices are connected, an audio tab becomes visible in the settings for your Axis network video device. Go to the audio tab and turn on **Allow audio**.

See your Axis portcast device's user manual for more information.

## Set up washer

### Note

The washer is optional.

1. Go to **System > Accessories > I/O Ports**.
2. For the port used with the washer – set **Output** as the direction.
3. Go to the live view and use the joystick (or mouse) to position the washer nozzle in the center of the image.
4. Go to **System > Accessories > Washer**.
5. Turn on **Lock nozzle position**.
6. Under **Pump connection**, select the pin (I/O port) the washer is connected to.

7. To set the duration of the washer sequence in seconds, enter a value under **Pump time**. The wiper starts when there is 5 seconds left of this time.
8. To set the duration of the wiper sequence in seconds, enter a value under **Wiper time**.

The below table provides some examples of different washer-wiper sequence setups.

Time elapsed (seconds)	Washer pump time: 10 s	Washer pump time: 20 s
	Washer wiper time: 10 s	Washer wiper time: 12 s
0	Washer starts	Washer starts
10	Washer stops	—
20	—	Washer stops

## The web interface

To reach the device's web interface, type the device's IP address in a web browser.

### Note

Support for the features and settings described in this section varies between devices. This icon  indicates that the feature or setting is only available in some devices.

Show or hide the main menu.

Access the release notes.

Access the product help.

Change the language.

Set light theme or dark theme.

The user menu contains:

- Information about the user who is logged in.
-  **Change account** : Log out from the current account and log in to a new account.
-  **Log out** : Log out from the current account.

The context menu contains:

- **Analytics data**: Accept to share non-personal browser data.
- **Feedback**: Share any feedback to help us improve your user experience.
- **Legal**: View information about cookies and licenses.
- **About**: View device information, including AXIS OS version and serial number.

## Status

### Device info

Shows the device information, including AXIS OS version and serial number.

**Upgrade AXIS OS:** Upgrade the software on your device. Takes you to the Maintenance page where you can do the upgrade.

### Time sync status

Shows NTP synchronization information, including if the device is in sync with an NTP server and the time remaining until the next sync.

**NTP settings:** View and update the NTP settings. Takes you to the **Time and location** page where you can change the NTP settings.

## Security

Shows what kind of access to the device that is active, what encryption protocols are in use, and if unsigned apps are allowed. Recommendations to the settings are based on the AXIS OS Hardening Guide.

**Hardening guide:** Link to *AXIS OS Hardening guide* where you can learn more about cybersecurity on Axis devices and best practices.

### **PTZ**

Shows the PTZ status and the time of the last test.

**Test:** Start a test of the PTZ mechanics. During the test, there are no video streams available. When the test is finished, the device restores to its home position.

### **Connected clients**

Shows the number of connections and connected clients.

**View details:** View and update the list of connected clients. The list shows IP address, protocol, port, state, and PID/process of each connection.

### **Ongoing recordings**

Shows ongoing recordings and their designated storage space.

**Recordings:** View ongoing and filtered recordings and their source. For more information, see

Shows the storage space where the recording is saved.

### **Video**

Click-and-drag to pan and tilt in the live view.

**Zoom** Use the slider to zoom in and out.

**Focus** Use this setting to set focus in the shown area. Depending on the device, different focus modes are available.

- **Auto:** The camera automatically adjusts focus based on the entire image.
- **Manual:** Set the focus manually at a fixed distance.
- **Area:** The camera automatically adjusts focus for a selected area of the image.
- **Spot:** The camera automatically adjusts focus for the center of the image.

**Brightness** Use this setting to adjust the light intensity in the image, for example, to make objects easier to see. Brightness is applied after image capture, and does not affect the information in the image. To get more details in a dark area, it is sometimes better to try to increase gain or increase exposure time.

Click to play the live video stream.

Click to freeze the live video stream.

Click to take a snapshot of the live video stream. The file is saved in the 'Downloads' folder on your computer. The image file name is [snapshot\_YYYY\_MM\_DD\_HH\_MM\_SS.jpg]. The size of the snapshot depends on the compression that the specific web-browser engine where the snapshot is received applies, therefore, the snapshot size may vary from the actual compression setting that is configured in the device.

Click to show I/O output ports. Use the switch to open or close the circuit of a port, for example, to test external devices.

Click to manually turn on or turn off the IR illumination.

Click to manually turn on or turn off the white light.

Click to access onscreen controls. Enable groups of onscreen controls to make the settings in each group available when users right-click the live stream in the video management software.

- **Predefined controls:** Lists the default onscreen controls.

- **Custom controls:** Click  **Add custom control** to create customized onscreen controls.

Starts the washer. When the sequence starts, the camera moves to the configured position to receive the wash spray. When the whole wash sequence is completed, the camera returns to its previous position. This icon is only visible when the washer is connected and configured.

Starts the wiper.

Click and select a preset position to go to that preset position in the live view. Or, click **Setup** to go to the preset position page.

Adds or removes a focus recall area. When you add a focus recall area, the camera saves the focus settings at that specific pan/tilt range. When you have set a focus recall area and the camera enters that area in the live view, the camera recalls the previously saved focus. It's enough to cover half of the area for the camera to recall the focus.

Click to select a guard tour, then click **Start** to play the guard tour. Or, click **Setup** to go to the guard tours page.

Click to manually turn on the heater for a selected period of time.

Click to start a continuous recording of the live video stream. Click again to stop the recording. If a recording is ongoing, it will resume automatically after a reboot.

Click to show the storage that is configured for the device. To configure the storage, you need to be logged in as an administrator.

Click to access autotracking settings. More settings are available if you click the icon from **Analytics > Autotracking**.

Click to access more settings:

- **Video format:** Select the encoding format to use in the live view.
-  **Autoplay:** Turn on to autoplay a muted video stream whenever you open the device in a new session.
- **Client stream information:** Turn on to show dynamic information about the video stream used by the browser that shows the live video stream. The bitrate information differs from the information shown in a text overlay, because of different information sources. The bitrate in the client stream information is the bitrate of the last second, and it comes from the encoding driver of the device. The bitrate in the overlay is the average bitrate of the last 5 seconds, and it comes from the browser. Both values cover only the raw video stream and not the additional bandwidth generated when it's transported over the network through UDP/TCP/HTTP.
- **Adaptive stream:** Turn on to adapt the image resolution to the viewing client's actual display resolution, to improve the user experience and help prevent a possible overload of the client's hardware. The adaptive stream is only applied when you view the live video stream in the web interface in a browser. When adaptive stream is turned on, the maximum frame rate is 30 fps. If you take a snapshot while adaptive stream is turned on, it will use the image resolution selected by the adaptive stream.
- **Level grid:** Click  to show the level grid. The grid helps you decide if the image is horizontally aligned. Click  to hide it.
- **Pixel counter:** Click  to show the pixel counter. Drag and resize the box to contain your area of interest. You can also define the pixel size of the box in the **Width** and **Height** fields.
- **Refresh:** Click  to refresh the still image in the live view.
- **PTZ controls**  : Turn on to display PTZ controls in the live view.

Click to show the live view at full resolution. If the full resolution is larger than your screen size, use the smaller image to navigate in the image.

Click to show the live video stream in expanded full screen. Click again to exit the expanded full screen mode.

Click to show the live video stream in full screen. Press ESC to exit full screen mode.

## Installation

**Capture mode**  : A capture mode is a preset configuration that defines how the camera captures images. When you change the capture mode, it can affect many other settings, such as view areas and privacy masks.

**Mounting position**  : The orientation of the image can change depending on how you mount the camera.

**Power line frequency:** To minimize image flicker, select the frequency your region uses. The American regions usually use 60 Hz. The rest of the world mostly uses 50 Hz. If you're not sure of your region's power line frequency, check with the local authorities.

## Image correction

### Important

We recommend you not to use multiple image correction features at the same time, since it can lead to performance issues.

**Barrel distortion correction (BDC)** ⓘ : Turn on to get a straighter image if it suffers from barrel distortion. Barrel distortion is a lens effect that makes the image appear curved and bent outwards. The condition is seen more clearly when the image is zoomed out.

**Crop** ⓘ : Use the slider to adjust the correction level. A lower level means that the image width is kept at the expense of image height and resolution. A higher level means that image height and resolution are kept at the expense of image width.

**Remove distortion** ⓘ : Use the slider to adjust the correction level. Pucker means that the image width is kept at the expense of image height and resolution. Bloat means that image height and resolution are kept at the expense of image width.

**Image stabilization** ⓘ : Turn on to get a smoother and steadier image with less blur. We recommend that you use image stabilization in environments where the device is mounted in an exposed location and subject to vibrations due to, for example, wind or passing traffic.

**Focal length** ⓘ : Use the slider to adjust the focal length. A higher value leads to higher magnification and a narrower angle of view, while a lower value leads to a lower magnification and a wider angle of view.

**Stabilizer margin** ⓘ : Use the slider to adjust the size of the stabilizer margin, which determines the level of vibration to stabilize. If the product is mounted in an environment with a lot of vibration, move the slider towards **Max**. As a result, a smaller scene is captured. If the environment has less vibration, move the slider towards **Min**.

**Focus breathing correction** ⓘ : Turn on to keep the angle of view constant while you change the focus. You might not be able to zoom in as much with this function activated.

**Straighten image** ⓘ : Turn on and use the slider to straighten the image horizontally by rotating and cropping it digitally. The functionality is useful when it's not possible to mount the camera exactly level. Ideally, straighten the image during installation.

: Click to show a supporting grid in the image.

: Click to hide the grid.

*The image before and after it has been straightened.*

## Zoom synchronization

Shows whether zoom synchronization between visual and thermal channels is turned on or turned off.

## Image

### Appearance

**Scene profile** ⓘ : Select a scene profile that suits your surveillance scenario. A scene profile optimizes image settings, including color level, brightness, sharpness, contrast, and local contrast, for a specific environment or purpose.

- **Forensic** ⓘ : Suitable for surveillance purposes.
- **Indoor** ⓘ : Suitable for indoor environments.
- **Outdoor** ⓘ : Suitable for outdoor environments.
- **Vivid** ⓘ : Useful for demonstration purposes.
- **Traffic overview** ⓘ : Suitable for vehicle traffic monitoring.
- **License plate** ⓘ : Suitable for capturing license plates.

**Saturation:** Use the slider to adjust the color intensity. You can, for example, get a grayscale image.

**Contrast:** Use the slider to adjust the difference between light and dark.

**Brightness:** Use the slider to adjust the light intensity. This can make objects easier to see. Brightness is applied after image capture, and doesn't affect the information in the image. To get more details from a dark area, it's usually better to increase gain or exposure time.

**Sharpness:** Use the slider to make objects in the image appear sharper by adjusting the edge contrast. If you increase the sharpness, it may increase the bitrate and the amount of storage space needed as well.

## Wide dynamic range

**WDR** ⓘ : Turn on to make both bright and dark areas of the image visible.

**Local contrast** ⓘ : Use the slider to adjust the contrast of the image. A higher value makes the contrast higher between dark and light areas.

**Tone mapping** ⓘ : Use the slider to adjust the amount of tone mapping that is applied to the image. If the value is set to zero, only the standard gamma correction is applied, while a higher value increases the visibility of the darkest and brightest parts in the image.

## White balance

When the camera detects the color temperature of the incoming light, it can adjust the image to make the colors look more natural. If this is not sufficient, you can select a suitable light source from the list.

The automatic white balance setting reduces the risk of color flicker by adapting to changes gradually. If the lighting changes, or when the camera is first started, it can take up to 30 seconds to adapt to the new light source. If there is more than one type of light source in a scene, that is, they differ in color temperature, the dominating light source acts as a reference for the automatic white balance algorithm. This behavior can be overridden by choosing a fixed white balance setting that matches the light source you want to use as a reference.

#### Light environment:

- **Automatic:** Automatic identification and compensation for the light source color. This is the recommended setting which can be used in most situations.
- **Automatic – outdoors**  : Automatic identification and compensation for the light source color. This is the recommended setting which can be used in most outdoor situations.
- **Custom – indoors**  : Fixed color adjustment for a room with some artificial light other than fluorescent lighting and good for a normal color temperature around 2800 K.
- **Custom – outdoors**  : Fixed color adjustment for sunny weather conditions with a color temperature around 5500 K.
- **Fixed – fluorescent 1:** Fixed color adjustment for fluorescent lighting with a color temperature around 4000 K.
- **Fixed – fluorescent 2:** Fixed color adjustment for fluorescent lighting with a color temperature around 3000 K.
- **Fixed – indoors:** Fixed color adjustment for a room with some artificial light other than fluorescent lighting and good for a normal color temperature around 2800 K.
- **Fixed – outdoors 1:** Fixed color adjustment for sunny weather conditions with a color temperature around 5500 K.
- **Fixed – outdoors 2:** Fixed color adjustment for cloudy weather condition with a color temperature around 6500 K.
- **Street light – mercury**  : Fixed color adjustment for ultraviolet emission in mercury vapor lights common in street lighting.
- **Street light – sodium**  : Fixed color adjustment that compensates for the yellow orange color of sodium vapor lights common in street lighting.
- **Hold current:** Keep the current settings and do not compensate for light changes.
- **Manual**  : Fix the white balance with the help of a white object. Drag the circle to an object that you want the camera to interpret as white in the live view image. Use the **Red balance** and **Blue balance** sliders to adjust the white balance manually.

#### Day-night mode

#### IR-cut filter:

- **Auto:** Select to automatically turn on and off the IR-cut filter. When the camera is in day mode, the IR-cut filter is turned on and blocks incoming infrared light, and when in night mode, the IR-cut filter is turned off and the camera's light sensitivity increases.

#### Note

- Some devices have IR-pass filters in night mode. The IR-pass filter increases IR-light sensitivity but blocks visible light.
- **On:** Select to turn on the IR-cut filter. The image is in color, but with reduced light sensitivity.
- **Off:** Select to turn off the IR-cut filter. The image is in black and white for increased light sensitivity.

**IR pass filter**  : Turn on to block visible light and only allow near infrared light to pass through. This toggle button is only available when the IR-cut filter is set to **Off**.

**Threshold:** Use the slider to adjust the light threshold where the camera changes from day mode to night mode.

- Move the slider towards **Bright** to decrease the threshold for the IR-cut filter. The camera changes to night mode earlier.
- Move the slider towards **Dark** to increase the threshold for the IR-cut filter. The camera changes to night mode later.

#### IR light

If your device doesn't have built-in illumination, these controls are only available when you connect a supported Axis illuminator.

**Allow illumination:** Turn on to let the camera use the built-in light in night mode.

**Synchronize illumination:** Turn on to automatically synchronize the illumination with the surrounding light. The synchronization between day and night only works if the IR-cut filter is set to **Auto** or **Off**.

**Automatic illumination angle**  : Turn on to use the automatic illumination angle. Turn off to set the illumination angle manually.

**Illumination angle**  : Use the slider to manually set the illumination angle, for example, if the angle needs to be different from the camera's angle of view. If the camera has a wide angle of view, you can set the illumination angle to a narrower angle, which equals a greater tele position. This will result in dark corners in the image.

**IR wavelength**  : Select the desired wavelength for the IR light.

**White light** 

**Allow illumination**  : Turn on to let the camera use white light in night mode.

**Synchronize illumination**  : Turn on to automatically synchronize the white light with the surrounding light.

#### Exposure

Select an exposure mode to reduce rapidly changing irregular effects in the image, for example, flicker produced by different types of light sources. We recommend you to use the automatic exposure mode, or the same frequency as your power network.

#### Exposure mode:

- **Automatic:** The camera adjusts the aperture, gain, and shutter automatically.
- **Automatic aperture** ⓘ : The camera adjusts the aperture and gain automatically. The shutter is fixed.
- **Automatic shutter** ⓘ : The camera adjusts the shutter and gain automatically. The aperture is fixed.
- **Hold current:** Locks the current exposure settings.
- **Flicker-free** ⓘ : The camera adjusts the aperture and gain automatically, and uses only the following shutter speeds: 1/50 s (50 Hz) and 1/60 s (60 Hz).
- **Flicker-free 50 Hz** ⓘ : The camera adjusts the aperture and gain automatically, and uses the shutter speed 1/50 s.
- **Flicker-free 60 Hz** ⓘ : The camera adjusts the aperture and gain automatically, and uses the shutter speed 1/60 s.
- **Flicker-reduced** ⓘ : This is the same as flicker-free, but the camera might use shutter speeds faster than 1/100 s (50 Hz) and 1/120 s (60 Hz) for brighter scenes.
- **Flicker-reduced 50 Hz** ⓘ : This is the same as flicker-free, but the camera might use shutter speeds faster than 1/100 s for brighter scenes.
- **Flicker-reduced 60 Hz** ⓘ : This is the same as flicker-free, but the camera might use shutter speeds faster than 1/120 s for brighter scenes.
- **Manual** ⓘ : The aperture, gain, and shutter are fixed.

**Exposure zone** ⓘ : Use exposure zones to optimize the exposure in a selected part of the scene, for example, the area in front of an entrance door.

#### Note

The exposure zones are related to the original image (unrotated), and the names of the zones apply to the original image. This means, for example, that if the video stream is rotated 90°, then the **Upper** zone becomes the **Right** zone in the stream, and **Left** becomes **Lower**.

- **Automatic:** Suitable for most situations.
- **Center:** Uses a fixed area in the center of the image to calculate the exposure. The area has a fixed size and position in the live view.
- **Full** ⓘ : Uses the entire live view to calculate the exposure.
- **Upper** ⓘ : Uses an area with a fixed size and position in the upper part of the image to calculate the exposure.
- **Lower** ⓘ : Uses an area with a fixed size and position in the lower part of the image to calculate the exposure.
- **Left** ⓘ : Uses an area with a fixed size and position in the left part of the image to calculate the exposure.

- **Right**  : Uses an area with a fixed size and position in the right part of the image to calculate the exposure.
- **Spot**: Uses an area with a fixed size and position in the live view to calculate the exposure.
- **Custom**: Uses an area in the live view to calculate the exposure. You can adjust the size and position of the area.

**Max shutter**: Select the shutter speed to provide the best image. Low shutter speeds (longer exposure) might cause motion blur when there is movement, and a too high shutter speed might affect the image quality. Max shutter works with max gain to improve the image.

**Max gain**: Select the suitable max gain. If you increase the max gain, it improves the visible level of detail in dark images, but also increases the noise level. More noise can also result in increased use of bandwidth and storage. If you set the max gain to a high value, images can differ a lot if the light conditions are very different from day to night. Max gain works with max shutter to improve the image.

**Motion-adaptive exposure**  : Select to reduce motion blur in low-light conditions.

**Blur-noise trade-off**: Use the slider to adjust the priority between motion blur and noise. If you want to prioritize low bandwidth and have less noise at the expense of details in moving objects, move the slider towards **Low noise**. If you want to prioritize the preservation of details in moving objects at the expense of noise and bandwidth, move the slider towards **Low motion blur**.

#### Note

You can change the exposure either by adjusting the exposure time or by adjusting the gain. If you increase the exposure time, it results in more motion blur, and if you increase the gain, it results in more noise. If you adjust the **Blur-noise trade-off** towards **Low noise**, the automatic exposure will prioritize longer exposure times over increasing gain, and the opposite if you adjust the trade-off towards **Low motion blur**. Both the gain and exposure time will eventually reach their maximum values in low-light conditions, regardless of the priority set.

**Lock aperture**  : Turn on to keep the aperture size set by the **Aperture** slider. Turn off to allow the camera to automatically adjust the aperture size. You can, for example, lock the aperture for scenes with permanent light conditions.

**Aperture**  : Use the slider to adjust the aperture size, that is, how much light passes through the lens. To allow more light to enter the sensor and thereby produce a brighter image in low-light conditions, move the slider towards **Open**. An open aperture also reduces the depth of field, which means that objects close to or far from the camera can appear unfocused. To allow more of the image to be in focus, move the slider towards **Closed**.

**Exposure level**: Use the slider to adjust the image exposure.

**Defog**  : Turn on to detect the effects of foggy weather and automatically remove them for a clearer image.

#### Note

We recommend you not to turn on **Defog** in scenes with low contrast, large light level variations, or when the autofocus is slightly off. This can affect the image quality, for example, by increasing the contrast. Furthermore, too much light can negatively impact the image quality when defog is active.

## General

**Name**: Enter a name for the selected camera.

## Stream

### General

**Resolution:** Select the image resolution suitable for the surveillance scene. A higher resolution increases bandwidth and storage.

**Palette**  : Select a palette to color the image with different colors depending on temperature. The palette can improve visibility of fine details.

**Frame rate:** To avoid bandwidth problems on the network or reduce storage size, you can limit the frame rate to a fixed amount. If you leave the frame rate at zero, the frame rate is kept at the highest possible rate under the current conditions. A higher frame rate requires more bandwidth and storage capacity.

**P-frames:** A P-frame is a predicted image that shows only the changes in the image from the previous frame. Enter the desired number of P-frames. The higher the number, the less bandwidth is required. However, if there is network congestion, there could be a noticeable deterioration in the video quality.

**Compression:** Use the slider to adjust the image compression. High compression results in a lower bitrate and lower image quality. Low compression improves the image quality, but uses more bandwidth and storage when you record.

**Signed video**  : Turn on to add the signed video feature to the video. Signed video protects the video from tampering by adding cryptographic signatures to the video.

### Zipstream

Zipstream is a bitrate reduction technology, optimized for video surveillance, that reduces the average bitrate in an H.264, H.265, or AV1 stream in real time. Axis Zipstream applies a high bitrate in scenes where there are multiple regions of interest, for example, in scenes with moving objects. When the scene is more static, Zipstream applies a lower bitrate, and thereby reduces the required storage. To learn more, see *Reducing the bit rate with Axis Zipstream*

Select the bitrate reduction **Strength**:

- **Off**: No bitrate reduction.
- **Low**: No visible quality degradation in most scenes. This is the default option and it can be used in all types of scenes to reduce the bitrate.
- **Medium**: Visible effects in some scenes through less noise and a slightly lower level of detail in regions of lower interest, for example, where there's no movement.
- **High**: Visible effects in some scenes through less noise and a lower level of detail in regions of lower interest, for example, where there's no movement. We recommend this level for cloud-connected devices and devices that use local storage.
- **Higher**: Visible effects in some scenes through less noise and a lower level of detail in regions of lower interest, for example, where there's no movement.
- **Extreme**: Visible effects in most scenes. The bitrate is optimized for smallest possible storage.

**Optimize for storage**: Turn on to minimize the bitrate while maintaining quality. The optimization does not apply to the stream shown in the web client. This can only be used if your VMS supports B-frames. Turning on **Optimize for storage** also turns on **Dynamic GOP**.

**Dynamic FPS** (frames per second): Turn on to allow the bandwidth to vary based on the level of activity in the scene. More activity requires more bandwidth.

- **Lower limit**: Enter a value to adjust the frame rate between minimal fps and the stream default fps based on scene motion. We recommend you to use lower limit in scenes with very little motion, where the fps could drop to 1 or lower.

**Dynamic GOP** (Group of Pictures): Turn on to dynamically adjust the interval between I-frames based on the level of activity in the scene.

- **Upper limit**: Enter a maximum GOP length, that is, the maximum number of P-frames between two I-frames. An I-frame is a self-contained image frame that is independent of other frames.

## Bitrate control

- **Average**: Select to automatically adjust the bitrate over a longer time period and provide the best possible image quality based on the available storage.
  -  Click to calculate the target bitrate based on available storage, retention time, and bitrate limit.
  - **Target bitrate**: Enter desired target bitrate.
  - **Retention time**: Enter the number of days to keep the recordings.
  - **Storage**: Shows the estimated storage that can be used for the stream.
  - **Maximum bitrate**: Turn on to set a bitrate limit.
  - **Bitrate limit**: Enter a bitrate limit that is higher than the target bitrate.
- **Maximum**: Select to set a maximum instant bitrate of the stream based on your network bandwidth.
  - **Maximum**: Enter the maximum bitrate.
- **Variable**: Select to allow the bitrate to vary based on the level of activity in the scene. More activity requires more bandwidth. We recommend this option for most situations.

## Audio

**Include:** Turn on to use audio in the video stream.

**Source**  : Select what audio source to use.

**Stereo**  : Turn on to include built-in audio as well as audio from an external microphone.

## Overlays

: Click to add an overlay. Select the type of overlay from the dropdown list:

- **Text:** Select to show a text that is integrated in the live view image and visible in all views, recordings and snapshots. You can enter your own text, and you can also include pre-configured modifiers to automatically show, for example, time, date, and frame rate.
  -  : Click to add the date modifier %F to show yyyy-mm-dd.
  -  : Click to add the time modifier %X to show hh:mm:ss (24-hour clock).
  - **Modifiers:** Click to select any of the modifiers shown in the list to add them to the text box. For example, %a shows the day of the week.
  - **Size:** Select the desired font size.
  - **Appearance:** Select the text color and background color, for example, white text on a black background (default).
  -  : Select the position of the overlay in the image or click and drag the overlay to move it around in the live view.
- **Image:** Select to show a static image superimposed over the video stream. You can use .bmp, .png, .jpeg, or .svg files.  
To upload an image, click **Manage images**. Before you upload an image, you can choose to:
  - **Scale with resolution:** Select to automatically scale the overlay image to fit the video resolution.
  - **Use transparency:** Select and enter the RGB hexadecimal value for that color. Use the format RRGGBB. Examples of hexadecimal values: FFFFFFFF for white, 000000 for black, FF0000 for red, 6633FF for blue, and 669900 for green. Only for .bmp images.
- **Scene annotation**  : Select to show a text overlay in the video stream that stays in the same position, even when the camera pans or tilts in another direction. You can choose to only show the overlay within certain zoom levels.
  -  : Click to add the date modifier %F to show yyyy-mm-dd.
  -  : Click to add the time modifier %X to show hh:mm:ss (24-hour clock).
  - **Modifiers:** Click to select any of the modifiers shown in the list to add them to the text box. For example, %a shows the day of the week.
  - **Size:** Select the desired font size.
  - **Appearance:** Select the text color and background color, for example, white text on a black background (default).
  -  : Select the position of the overlay in the image or click and drag the overlay to move it around in the live view. The overlay is saved and remains in the pan and tilt coordinates of this position.
  - **Annotation between zoom levels (%):** Set the zoom levels which the overlay will be shown within.
  - **Annotation symbol:** Select a symbol that appears instead of the overlay when the camera is not within the set zoom levels.
- **Streaming indicator**  : Select to show an animation superimposed over the video stream. The animation indicates that the video stream is live, even if the scene doesn't contain any motion.

- **Appearance:** Select the animation color and background color, for example, red animation on a transparent background (default).
- **Size:** Select the desired font size.
-  : Select the position of the overlay in the image or click and drag the overlay to move it around in the live view.
- **Widget: Linegraph**  : Show a graph chart that displays how a measured value changes over time.
  - **Title:** Enter a title for the widget.
  - **Overlay modifier:** Select an overlay modifier as data source. If you have created MQTT overlays, they will be located at the end of the list.
  -  : Select the position of the overlay in the image or click and drag the overlay to move it around in the live view.
  - **Size:** Select the size of the overlay.
  - **Visible on all channels:** Turn off to show only on your currently selected channel. Turn on to show on all active channels.
  - **Update interval:** Choose the time between data updates.
  - **Transparency:** Set the transparency of the entire overlay.
  - **Background transparency:** Set the transparency only of the background of the overlay.
  - **Points:** Turn on to add a point to the graph line when data is updated.
  - **X axis**
    - **Label:** Enter the text label for the x axis.
    - **Time window:** Enter how long time the data is visualized.
    - **Time unit:** Enter a time unit for the x axis.
  - **Y axis**
    - **Label:** Enter the text label for the y axis.
    - **Dynamic scale:** Turn on for the scale to automatically adapt to the data values. Turn off to manually enter values for a fixed scale.
    - **Min alarm threshold and Max alarm threshold:** These values will add horizontal reference lines to the graph, making it easier to see when the data value becomes too high or too low.
- **Widget: Meter**  : Show a bar chart that displays the most recently measured data value.
  - **Title:** Enter a title for the widget.
  - **Overlay modifier:** Select an overlay modifier as data source. If you have created MQTT overlays, they will be located at the end of the list.
  -  : Select the position of the overlay in the image or click and drag the overlay to move it around in the live view.
  - **Size:** Select the size of the overlay.
  - **Visible on all channels:** Turn off to show only on your currently selected channel. Turn on to show on all active channels.
  - **Update interval:** Choose the time between data updates.
  - **Transparency:** Set the transparency of the entire overlay.
  - **Background transparency:** Set the transparency only of the background of the overlay.
  - **Points:** Turn on to add a point to the graph line when data is updated.

- **Y axis**
  - **Label:** Enter the text label for the y axis.
  - **Dynamic scale:** Turn on for the scale to automatically adapt to the data values. Turn off to manually enter values for a fixed scale.
  - **Min alarm threshold and Max alarm threshold:** These values will add horizontal reference lines to the bar chart, making it easier to see when the data value becomes too high or too low.

## Privacy masks

: Click to create a new privacy mask.

**Privacy masks x/32 or Privacy masks x/100:** Click this title bar to change the color of all privacy masks, or to delete all privacy masks permanently.

**Cell size:** If you choose the mosaic color, the privacy masks appear as pixilated patterns. Use the slider to change the size of the pixels.

**Mask x:** Click an individual mask name/number to rename, disable, or permanently delete that mask.

**Use zoom level:** Turn on to make this privacy mask appear only when it reaches the zoom level at which it was created. Zooming out in the image hides the mask again.

## Analytics

### Metadata configuration

#### RTSP metadata producers

View and manage the data channels that stream metadata and the channels they use.

#### Note

These settings are for the RTSP metadata stream that uses ONVIF XML. Changes made here don't affect the Metadata visualization page.

**Producer:** A data channel that uses Real-Time Streaming Protocol (RTSP) to send metadata.

**Channel:** The channel used to send metadata from a producer. Turn on to enable the metadata stream. Turn off for compatibility or resource management reasons.

### MQTT

Configure the producers that generate and stream metadata over MQTT (Message Queuing Telemetry Transport).

-  **Create:** Click to create a new MQTT producer.
  - **Key:** Select a predefined identifier from the dropdown list to specify the source of the metadata stream.
  - **MQTT topic:** Enter a name for the MQTT topic.
  - **QoS (Quality of Service):** Set the level of message delivery assurance (0-2).

**Retain messages:** Choose whether to retain the last message on the MQTT topic.

**Use MQTT client device topic prefix:** Choose whether to add a prefix to the MQTT topic to help identify the source device.

The context menu contains:

- **Update:** Modify the settings of the selected producer.
- **Delete:** Delete the selected producer.

**Object snapshot:** Turn on to include a cropped image of each detected object.

**Additional crop margin:** Turn on to add extra margin around cropped images of detected objects.

## PTZ

### Preset positions

A preset position is a specific pan, tilt, and zoom position stored in your camera's memory. You can use preset positions to quickly navigate between different fields of view. If your device supports guard tours, you can use preset positions to create automated guard tours.

#### Preset positions

-  **Create preset position:** Create a new preset position based on the current position of your camera.
  - **Thumbnail:** Turn on to add a thumbnail image for the preset position.
  - **Name:** Enter a name for the preset position.
  - **Home position:** Turn on to set this position as your camera's default field of view. The home position is marked with . Your camera will always have a home position.

#### Settings

- **Return to home position when inactive:** Turn on to make the camera return to its home position after a specified period of inactivity.
- **Use thumbnails:** Turn on to automatically add a thumbnail to any new preset position you create.

The context menu contains:

- **Create thumbnails**  : Create a thumbnail for all your preset positions.
- **Refresh thumbnails:** Replace the thumbnails for your preset positions with new and updated thumbnails.
- **Delete all preset positions:** Remove all your preset positions. This will also create a new home position automatically.

## Guard tours

**Guard tour:** Create a guard tour.

- **Preset position:** Select to create a guard tour with preset positions.
- **Recorded:** Select to create a recorded guard tour.

## Preset position

A guard tour with preset positions continuously streams footage from a selection of preset positions in a random or fixed sequence. You can choose how long the camera should stay at each preset position before moving on to the next. The guard tour will continue to run in an endless loop until you stop it, even when there are no clients (web browsers) streaming the footage.

### Settings

- **General settings**
  - **Name:** Enter a name for the guard tour.
  - **Play guard tour in random order:** Turn on to make the camera move unpredictably between the preset positions during the guard tour.
  - **Pause between runs:** Enter your desired time interval between guard tours. You can enter any interval from 0 minutes to 2 hours and 45 minutes.
- **Step settings**
  - **Duration:** Choose how long you want the camera to stay at each preset position. The default value is 10 seconds, and the maximum allowed value is 60 minutes.
  - **Move speed:** Choose how quickly you want the camera to move to the next preset position. The default value is 70, but you can select any value from 1–100.

**Preset positions:** To select multiple preset positions, press SHIFT while selecting the preset positions. Click  and drag the preset positions to the **View order** area.

**View order:** Displays the preset positions included in the guard tour.

- **Import all preset positions:** Add all preset positions in the order they were created, starting from the oldest one.
-  : Start the guard tour.

## Recorded

A recorded tour replays a sequence of recorded pan/tilt/zoom movements, including their variable speeds and lengths.

### General settings

- **Name:** Enter a name for the guard tour.
- **Pause between runs:** Enter your desired time interval between guard tours. You can enter any interval from 0 minutes to 2 hours and 45 minutes.

### Recorded tour

- **Start recording tour:** Start recording the pan/tilt/zoom movements you want the guard tour to replicate.
- **Stop recording tour:** Stop recording the pan/tilt/zoom movements you want the guard tour to replicate.
- **Re-record:** Start a new recording of pan/tilt/zoom movements. This will overwrite your most recent recording.
-  Start the recorded tour.
-  Pause the recorded tour.
-  Stop the recorded tour.

### Limits

To narrow down the area under surveillance, you can limit the PTZ movements.

**Save as Pan 0** : Click to set the current position as zero-point for pan coordinates.

**Pan-tilt limits:** The camera uses the coordinates of the center of the image when you set pan-tilt limits.

-  **Left pan limit:** Click to limit the camera's pan movements to the left. Click again to remove the limit.
-  **Right pan limit:** Click to limit the camera's pan movements to the right. Click again to remove the limit.
-  **Top tilt limit:** Click to limit the camera's tilt movements to the top. Click again to remove the limit.
-  **Bottom tilt limit:** Click to limit the camera's tilt movements to the bottom. Click again to remove the limit.

**Auto-flip** : Enables the camera head to instantly reverse 360° and continue to pan beyond its mechanical limit.

**E-flip** : Automatically corrects the camera view by flipping the image 180° when the camera tilts beyond -90°.

**Nadir-flip** : Enables the camera to pan 180° when tilting beyond -90°, and then continue upwards.

**Zoom limit:** Select a value to limit the camera's maximum zoom level. Optical or digital (e.g. 480x D) values can be selected. When using a joystick, only digital zoom levels can be used to set the zoom limit.

**Near focus limit:** Select a value to prevent the camera from autofocus on objects close to the camera. This way, the camera can ignore objects such as overhead wires, streetlights, or other nearby objects. To make the camera focus on the areas of interest, set the near focus limit to a value greater than the distance at which the objects of no interest tend to appear.

## Motion

**Proportional speed**  : Turn on to set the maximum proportional speed.

- **Max proportional speed**  : Set a value between 1 and 1000 to limit the pan and tilt speed. Max proportional speed is defined as a percentage, where the value 1000 equals 1000%. This is useful when the joystick is pushed all the way out. For example, if the image is approximately 44 degrees wide when fully zoomed out and the max proportional speed is set to 100 (100%), the maximum speed is about 44 degrees/second. If the image is then zoomed in from 44 to 10 degrees wide, the maximum speed reaches about 10 degrees/second, which is probably too fast for easy viewing. To limit the speed, set the max proportional speed to 50 (50%). This way, the maximum speed only reaches 50% of the maximum for the currently selected zoom level. This means that when the image is 44 degrees wide, the greatest possible speed is limited to about 22 degrees/second, and when the view is zoomed in to 10 degrees the speed is limited to about 5 degrees/second.

**Adjustable zoom speed:** Turn on to use variable speeds when controlling the zoom with a joystick or a mouse wheel. The zoom speed is automatically set through the command `continuouszoommove` in the VAPIX® Application Programming Interface (API). Turn off to use the highest zoom speed which is the same speed for moving to presets.

### Freeze image on PTZ

- **Off:** Never freeze image.
- **All movements:** Freeze the image while the camera is moving. Once the camera reaches its new position, the view from that position is shown.
- **Preset positions:** Freeze the image only when the camera moves between preset positions.

**Pan-tilt speed:** Select the speed of the camera's pan and tilt movements.

## OSDI zones

On-screen direction indicator (OSDI) gives information of the direction the camera is pointing at in the text overlay. The camera uses the coordinates of the center of the image when you set the lower left and upper right zone area.

**Create OSDI zone:** Click to create an OSDI zone.

- **Name:** Enter a name for the zone.
- **Active:** Turn on to display the zone in the live view.
- **Zone limits**
  -  : Navigate to your desired position, and click the icon to set the lower left point of the zone. Click again to unset the lower left point.
  -  : Navigate to your desired position, and click the icon to set the upper right point of the zone. Click again to unset the upper right point.
  - **Go to:** Click to go to the lower left point or the upper right point of the zone.
- **The context menu contains:**
  - **Create multiple zones:** Click to create multiple zones. Enter a name for the zone, and specify the coordinates for lower left and upper right of the zone.
    - **Add zone coordinates:** Click to specify the parameters for another zone.
  - **Delete all zones:** Click to delete all zones.

## Orientation aid

**Orientation aid:** Turn on to activate overlays of user-defined points of interest at the correct bearing and a 2D-compass synchronized to the cameras movements, including a field of view.

### Direction

- **Set north:** Position the camera at north, and click **Set north**.

**Preset positions:** Select the preset positions used for orientation aid.

- To select an individual preset position, click the preset position.
- To select all preset positions, click .

## Gatekeeper

A gatekeeper monitors an area such as an entrance gate. When motion is detected in the monitored area, the gatekeeper steers the camera to a selected preset position. Using a zoomed-in preset position can make it possible to, for example, read a license plate or identify a person. When motion is no longer detected, the camera returns to its home position after a defined time.

## Control queue

### User control queue

- **PTZ control queue:** Turn on to place PTZ control requests in a queue. This displays the users status and position in the queue. To use the PTZ controls in AXIS Camera Station, turn off this setting.
  - **Enter queue:** Click to add your request for PTZ control to the queue.
  - **Release control:** Click to release the PTZ control.
- The user groups are listed in a prioritized order with the highest priority on top. To change the priority of a user group, click  and drag the user group up or down.  
For each user group:
  - **Timeout duration:** Set the amount of time to wait before timeout. The default value is 1 minute, and allowed values are from 1 second to 60 minutes.
  - **Timeout type**
    - **Timespan:** Time out after reaching the set duration.
    - **Activity:** Time out after reaching the set duration since the last activity.
    - **Infinity:** Never to time out until a user with higher priority takes control.
  - **Use cookie:** Select to allow the camera to recognize and separate users within the same user group.

### Settings

- **Limit number of users in queue:** Set the maximum number of users allowed in a queue. The default number is 20, and allowed values are 1–100.
- **Control queue poll time:** Set how often to poll the camera to update the place of the users or user groups in the queue. The default value is 20 seconds, and allowed values are from 5 seconds to 60 minutes.

## Audio

### Device settings

**Input:** Turn on or off audio input. Shows the type of input.

**Input type:** Select the type of input, for instance, if it's a microphone or line.

**Power type:** Select power type for your input.

**Apply changes:** Apply your selection.

**Echo cancellation**  : Turn on to remove echoes during two-way communication.

**Separate gain controls**  : Turn on to adjust the gain separately for the different input types.

**Automatic gain control**  : Turn on to dynamically adapt the gain to changes in the sound.

**Gain:** Use the slider to change the gain. Click the microphone icon to mute or unmute.

### Stream

**Encoding:** Select the encoding to use for the input source streaming. You can only choose encoding if audio input is turned on. If audio input is turned off, click **Enable audio input** to turn it on.

### Audio enhancement

#### Input

**Ten Band Graphic Audio Equalizer:** Turn on to adjust the level of different frequency bands within an audio signal. This feature is for advanced users with audio configuration experience.

**Talkback range**  : Choose the operational range to gather audio content. An increase to the operational range cause a reduction of simultaneous two-way communication capabilities.

**Voice enhancement**  : Turn on to enhance the voice content in relation to other sounds.

### Recordings

**Ongoing recordings:** Show all ongoing recordings on the device.

- Start a recording on the device.

Choose which storage device to save to.

- Stop a recording on the device.

**Triggered recordings** will end when manually stopped or when the device is shut down.

**Continuous recordings** will continue until manually stopped. Even if the device is shut down, the recording will continue when the device starts up again.

Play the recording.

Stop playing the recording.

Show or hide information and options about the recording.

**Set export range:** If you only want to export part of the recording, enter a time span. Note that if you work in a different time zone than the location of the device, the time span is based on the device's time zone.

**Encrypt:** Select to set a password for exported recordings. It will not be possible to open the exported file without the password.

Click to delete a recording.

**Export:** Export the whole or a part of the recording.

Click to filter the recordings.

**From:** Show recordings done after a certain point in time.

**To:** Show recordings up until a certain point in time.

**Source** ⓘ: Show recordings based on source. The source refers to the sensor.

**Event:** Show recordings based on events.

**Storage:** Show recordings based on storage type.

## Apps

Add app: Install a new app.

Find more apps: Find more apps to install. You will be taken to an overview page of Axis apps.

Allow unsigned apps : Turn on to allow installation of unsigned apps.

View the security updates in AXIS OS and ACAP apps.

### Note

The device's performance might be affected if you run several apps at the same time.

Use the switch next to the app name to start or stop the app.

Open: Access the app's settings. The available settings depend on the application. Some applications don't have any settings.

The context menu can contain one or more of the following options:

- **Open-source license:** View information about open-source licenses used in the app.
- **App log:** View a log of the app events. The log is helpful when you contact support.
- **Activate license with a key:** If the app requires a license, you need to activate it. Use this option if your device doesn't have internet access.  
If you don't have a license key, go to [axis.com/products/analytics](https://axis.com/products/analytics). You need a license code and the Axis product serial number to generate a license key.
- **Activate license automatically:** If the app requires a license, you need to activate it. Use this option if your device has internet access. You need a license code to activate the license.
- **Deactivate the license:** Deactivate the license to replace it with another license, for example, when you change from a trial license to a full license. If you deactivate the license, you also remove it from the device.
- **Settings:** Configure the parameters.
- **Delete:** Delete the app permanently from the device. If you don't deactivate the license first, it remains active.

## System

### Time and location

#### Date and time

The time format depends on the web browser's language settings.

### Note

We recommend you synchronize the device's date and time with an NTP server.

**Synchronization:** Select an option for the device's date and time synchronization.

- **Automatic date and time (PTP):** Synchronize using the precision time protocol.
- **Automatic date and time (manual NTS KE servers):** Synchronize with the secure NTP key establishment servers connected to the DHCP server.
  - **Manual NTS KE servers:** Enter the IP address of one or two NTP servers. When you use two NTP servers, the device synchronizes and adapts its time based on input from both.
  - **Trusted NTS KE CA certificates:** Select the trusted CA certificates to use for secure NTS KE time synchronization, or leave at none.
  - **Max NTP poll time:** Select the maximum amount of time the device should wait before it polls the NTP server to get an updated time.
  - **Min NTP poll time:** Select the minimum amount of time the device should wait before it polls the NTP server to get an updated time.
- **Automatic date and time (NTP servers using DHCP):** Synchronize with the NTP servers connected to the DHCP server.
  - **Fallback NTP servers:** Enter the IP address of one or two fallback servers.
  - **Max NTP poll time:** Select the maximum amount of time the device should wait before it polls the NTP server to get an updated time.
  - **Min NTP poll time:** Select the minimum amount of time the device should wait before it polls the NTP server to get an updated time.
- **Automatic date and time (manual NTP servers):** Synchronize with NTP servers of your choice.
  - **Manual NTP servers:** Enter the IP address of one or two NTP servers. When you use two NTP servers, the device synchronizes and adapts its time based on input from both.
  - **Max NTP poll time:** Select the maximum amount of time the device should wait before it polls the NTP server to get an updated time.
  - **Min NTP poll time:** Select the minimum amount of time the device should wait before it polls the NTP server to get an updated time.
- **Custom date and time:** Manually set the date and time. Click **Get from system** to fetch the date and time settings once from your computer or mobile device.

**Time zone:** Select which time zone to use. Time will automatically adjust to daylight saving time and standard time.

- **DHCP:** Adopts the time zone of the DHCP server. The device must be connected to a DHCP server before you can select this option.
- **Manual:** Select a time zone from the drop-down list.

**Note**

The system uses the date and time settings in all recordings, logs, and system settings.

## Device location

Enter where the device is located. Your video management system can use this information to place the device on a map.

- **Latitude:** Positive values are north of the equator.
- **Longitude:** Positive values are east of the prime meridian.
- **Heading:** Enter the compass direction that the device is facing. 0 is due north.
- **Label:** Enter a descriptive name for your device.
- **Save:** Click to save your device location.

## Network

### IPv4

**Assign IPv4 automatically:** Select IPv4 automatic IP (DHCP) to let the network assign your IP address, subnet mask, and router automatically, without manual configuration. We recommend using automatic IP assignment (DHCP) for most networks.

**IP address:** Enter a unique IP address for the device. Static IP addresses can be assigned at random within isolated networks, provided that each address is unique. To avoid conflicts, we recommend you contact your network administrator before you assign a static IP address.

**Subnet mask:** Enter the subnet mask to define what addresses are inside the local area network. Any address outside the local area network goes through the router.

**Router:** Enter the IP address of the default router (gateway) used to connect devices that are attached to different networks and network segments.

**Fallback to static IP address if DHCP isn't available:** Select if you want to add a static IP address to use as fallback if DHCP is unavailable and can't assign an IP address automatically.

#### Note

If DHCP isn't available and the device uses a static address fallback, the static address is configured with a limited scope.

### IPv6

**Assign IPv6 automatically:** Select to turn on IPv6 and to let the network router assign an IP address to the device automatically.

### Hostname

**Assign hostname automatically:** Select to let the network router assign a hostname to the device automatically.

**Hostname:** Enter the hostname manually to use as an alternative way of accessing the device. The server report and system log use the hostname. Allowed characters are A–Z, a–z, 0–9 and –.

**Enable dynamic DNS updates:** Allow your device to automatically update its domain name server records whenever its IP address changes.

**Register DNS name:** Enter a unique domain name that points to your device's IP address. Allowed characters are A–Z, a–z, 0–9 and –.

**TTL:** Time to Live (TTL) sets how long a DNS record stays valid before it needs to be updated.

### DNS servers

**Assign DNS automatically:** Select to let the DHCP server assign search domains and DNS server addresses to the device automatically. We recommend automatic DNS (DHCP) for most networks.

**Search domains:** When you use a hostname that is not fully qualified, click **Add search domain** and enter a domain in which to search for the hostname the device uses.

**DNS servers:** Click **Add DNS server** and enter the IP address of the DNS server. This provides the translation of hostnames to IP addresses on your network.

#### Note

If DHCP is disabled, features that rely on automatic network configuration, such as hostname, DNS servers, NTP, and others, may stop working.

## HTTP and HTTPS

HTTPS is a protocol that provides encryption for page requests from users and for the pages returned by the web server. The encrypted exchange of information is governed by the use of an HTTPS certificate, which guarantees the authenticity of the server.

To use HTTPS on the device, you must install an HTTPS certificate. Go to **System > Security** to create and install certificates.

**Allow access through:** Select if a user is allowed to connect to the device through the HTTP, HTTPS, or both HTTP and HTTPS protocols.

### Note

If you view encrypted web pages through HTTPS, you might experience a drop in performance, especially when you request a page for the first time.

**HTTP port:** Enter the HTTP port to use. The device allows port 80 or any port in the range 1024–65535. If you are logged in as an administrator, you can also enter any port in the range 1–1023. If you use a port in this range, you get a warning.

**HTTPS port:** Enter the HTTPS port to use. The device allows port 443 or any port in the range 1024–65535. If you are logged in as an administrator, you can also enter any port in the range 1–1023. If you use a port in this range, you get a warning.

**Certificate:** Select a certificate to enable HTTPS for the device.

## Network discovery protocols

**Bonjour®:** Turn on to allow automatic discovery on the network.

**Bonjour name:** Enter a friendly name to be visible on the network. The default name is the device name and MAC address.

**UPnP®:** Turn on to allow automatic discovery on the network.

**UPnP name:** Enter a friendly name to be visible on the network. The default name is the device name and MAC address.

**WS-Discovery:** Turn on to allow automatic discovery on the network.

**LLDP and CDP:** Turn on to allow automatic discovery on the network. Turning LLDP and CDP off can impact the PoE power negotiation. To resolve any issues with the PoE power negotiation, configure the PoE switch for hardware PoE power negotiation only.

## Global proxies

**Http proxy:** Specify a global proxy host or IP address according to the allowed format.

**Https proxy:** Specify a global proxy host or IP address according to the allowed format.

Allowed formats for http and https proxies:

- `http(s)://host:port`
- `http(s)://user@host:port`
- `http(s)://user:pass@host:port`

#### Note

Restart the device to apply the global proxy settings.

**No proxy:** Use **No proxy** to bypass global proxies. Enter one of the options in the list, or enter several separated by a comma:

- Leave empty
- Specify an IP address
- Specify an IP address in CIDR format
- Specify a domain name, for example: `www.<domain name>.com`
- Specify all subdomains in a specific domain, for example `.<domain name>.com`

## One-click cloud connection

One-click cloud connection (O3C) together with an O3C service provides easy and secure internet access to live and recorded video from any location. For more information, see [axis.com/end-to-end-solutions/hosted-services](http://axis.com/end-to-end-solutions/hosted-services).

#### Allow O3C:

- **One-click:** This is the default option. To connect to O3C, press the control button on the device. Depending on the device model, either press and release or press and hold, until the status LED flashes. Register the device with the O3C service within 24 hours to enable **Always** and stay connected. If you don't register, the device will disconnect from O3C.
- **Always:** The device continuously attempts to connect to an O3C service over the internet. Once you register the device, it stays connected. Use this option if the control button is out of reach.
- **No:** Disconnects the O3C service.

**Proxy settings:** If needed, enter the proxy settings to connect to the proxy server.

**Host:** Enter the proxy server's address.

**Port:** Enter the port number used for access.

**Login and Password:** If needed, enter username and password for the proxy server.

#### Authentication method:

- **Basic:** This method is the most compatible authentication scheme for HTTP. It's less secure than the **Digest** method because it sends the username and password unencrypted to the server.
- **Digest:** This method is more secure because it always transfers the password encrypted across the network.
- **Auto:** This option lets the device select the authentication method depending on the supported methods. It prioritizes the **Digest** method over the **Basic** method.

**Owner authentication key (OAK):** Click **Get key** to fetch the owner authentication key. This is only possible if the device is connected to the internet without a firewall or proxy.

## SNMP

The Simple Network Management Protocol (SNMP) allows remote management of network devices.

**SNMP:** Select the version of SNMP to use.

- **v1 and v2c:**
  - **Read community:** Enter the community name that has read-only access to all supported SNMP objects. The default value is **public**.
  - **Write community:** Enter the community name that has read or write access to all supported SNMP objects (except read-only objects). The default value is **write**.
  - **Activate traps:** Turn on to activate trap reporting. The device uses traps to send messages for important events or status changes to a management system. In the web interface, you can set up traps for SNMP v1 and v2c. Traps are automatically turned off if you change to SNMP v3 or turn off SNMP. If you use SNMP v3, you can set up traps through the SNMP v3 management application.
  - **Trap address:** Enter the IP address or host name of the management server.
  - **Trap community:** Enter the community to use when the device sends a trap message to the management system.
  - **Traps:**
    - **Cold start:** Sends a trap message when the device starts.
    - **Link up:** Sends a trap message when a link changes from down to up.
    - **Link down:** Sends a trap message when a link changes from up to down.
    - **Authentication failed:** Sends a trap message when an authentication attempt fails.

**Note**

All Axis Video MIB traps are enabled when you turn on SNMP v1 and v2c traps. For more information, see *AXIS OS Portal > SNMP*.

- **v3:** SNMP v3 is a more secure version, which provides encryption and secure passwords. To use SNMP v3, we recommend you to activate HTTPS, as the password is then sent through HTTPS. This also prevents unauthorized parties' access to unencrypted SNMP v1 and v2c traps. If you use SNMP v3, you can set up traps through the SNMP v3 management application.
  - **Password for the account "initial":** Enter the SNMP password for the account named "initial". Although the password can be sent without activating HTTPS, we don't recommend it. The SNMP v3 password can only be set once, and preferably only when HTTPS is enabled. Once the password is set, the password field is no longer displayed. To set the password again, you must reset the device to factory default settings.

## Security

### Certificates

Certificates are used to authenticate devices on a network. The device supports two types of certificates:

- **Client/server certificates**  
A client/server certificate validates the device's identity, and can be self-signed or issued by a Certificate Authority (CA). A self-signed certificate offers limited protection and can be used before a CA-issued certificate has been obtained.
- **CA certificates**  
You can use a CA certificate to authenticate a peer certificate, for example to validate the identity of an authentication server when the device connects to a network protected by IEEE 802.1X. The device has several pre-installed CA certificates.

These formats are supported:

- Certificate formats: .PEM, .CER, and .PFX
- Private key formats: PKCS#1 and PKCS#12

#### Important

If you reset the device to factory default, all certificates are deleted. Any pre-installed CA certificates are reinstalled.

**Add certificate** : Click to add a certificate. A step-by-step guide opens up.

- **More**  : Show more fields to fill in or select.
- **Secure keystore**: Select to use **Trusted Execution Environment (SoC TEE)**, **Secure element** or **Trusted Platform Module 2.0** to securely store the private key. For more information on which secure keystore to select, go to [help.axis.com/axis-os#cryptographic-support](http://help.axis.com/axis-os#cryptographic-support).
- **Key type**: Select the default or a different encryption algorithm from the drop-down list to protect the certificate.

The context menu contains:

- **Certificate information**: View an installed certificate's properties.
- **Delete certificate**: Delete the certificate.
- **Create certificate signing request**: Create a certificate signing request to send to a registration authority to apply for a digital identity certificate.

**Secure keystore**  :

- **Trusted Execution Environment (SoC TEE)**: Select to use SoC TEE for secure keystore.
- **Secure element (CC EAL6+, FIPS 140-3 Level 3)**  : Select to use secure element for secure keystore.
- **Trusted Platform Module 2.0 (CC EAL4+, FIPS 140-2 Level 2)**  : Select to use TPM 2.0 for secure keystore.

## Cryptographic policy

The cryptographic policy defines how encryption is used to protect data.

**Active**: Select which cryptographic policy to apply to the device:

- **Default — OpenSSL**: Balanced security and performance for general use.
- **FIPS — Policy to comply with FIPS 140-2**: Encryption compliant with FIPS 140-2 for regulated industries.

## Network access control and encryption

## **IEEE 802.1x**

IEEE 802.1x is an IEEE standard for port-based network admission control providing secure authentication of wired and wireless network devices. IEEE 802.1x is based on EAP (Extensible Authentication Protocol).

To access a network protected by IEEE 802.1x, network devices must authenticate themselves. The authentication is performed by an authentication server, typically a RADIUS server (for example, FreeRADIUS and Microsoft Internet Authentication Server).

## **IEEE 802.1AE MACsec**

IEEE 802.1AE MACsec is an IEEE standard for media access control (MAC) security that defines connectionless data confidentiality and integrity for media access independent protocols.

## **Certificates**

When configured without a CA certificate, server certificate validation is disabled and the device tries to authenticate itself regardless of what network it is connected to.

When using a certificate, in Axis' implementation, the device and the authentication server authenticate themselves with digital certificates using EAP-TLS (Extensible Authentication Protocol - Transport Layer Security).

To allow the device to access a network protected through certificates, you must install a signed client certificate on the device.

**Authentication method:** Select an EAP type used for authentication.

**Client certificate:** Select a client certificate to use IEEE 802.1x. The authentication server uses the certificate to validate the client's identity.

**CA certificates:** Select CA certificates to validate the authentication server's identity. When no certificate is selected, the device tries to authenticate itself regardless of what network it is connected to.

**EAP identity:** Enter the user identity associated with the client certificate.

**EAPOL version:** Select the EAPOL version that is used in the network switch.

**Use IEEE 802.1x:** Select to use the IEEE 802.1x protocol.

These settings are only available if you use **IEEE 802.1x PEAP-MSCHAPv2** as the authentication method:

- **Password:** Enter the password for your user identity.
- **Peap version:** Select the Peap version that is used in the network switch.
- **Label:** Select 1 to use client EAP encryption; select 2 to use client PEAP encryption. Select the Label that the network switch uses when using Peap version 1.

These settings are only available if you use **IEEE 802.1ae MACsec (Static CAK/Pre-Shared Key)** as the authentication method:

- **Key agreement connectivity association key name:** Enter the connectivity association name (CKN). It must be 2 to 64 (divisible by 2) hexadecimal characters. The CKN must be manually configured in the connectivity association and must match on both ends of the link to initially enable MACsec.
- **Key agreement connectivity association key:** Enter the connectivity association key (CAK). It should be either 32 or 64 hexadecimal characters long. The CAK must be manually configured in the connectivity association and must match on both ends of the link to initially enable MACsec.

## **Prevent brute-force attacks**

**Blocking:** Turn on to block brute-force attacks. A brute-force attack uses trial-and-error to guess login info or encryption keys.

**Blocking period:** Enter the number of seconds to block a brute-force attack.

**Blocking conditions:** Enter the number of authentication failures allowed per second before the block starts. You can set the number of failures allowed both on page level and device level.

## Firewall

**Firewall:** Turn on to activate the firewall.

**Default Policy:** Select how you want the firewall to handle connection requests not covered by rules.

- **ACCEPT:** Allows all connections to the device. This option is set by default.
- **DROP:** Blocks all connections to the device.

To make exceptions to the default policy, you can create rules that allows or blocks connections to the device from specific addresses, protocols, and ports.

+ **New rule:** Click to create a rule.

**Rule type:**

- **FILTER:** Select to either allow or block connections from devices that match the criteria defined in the rule.
  - **Policy:** Select **Accept** or **Drop** for the firewall rule.
  - **IP range:** Select to specify a range of addresses to allow or block. Use IPv4/IPv6 in **Start** and **End**.
  - **IP address:** Enter an address that you want to allow or block. Use IPv4/IPv6 or CIDR format.
  - **Protocol:** Select a network protocol (TCP, UDP, or Both) to allow or block. If you select a protocol, you must also specify a port.
  - **MAC:** Enter the MAC address of a device that you want to allow or block.
  - **Port range:** Select to specify the range of ports to allow or block. Add them in **Start** and **End**.
  - **Port:** Enter a port number that you want to allow or block. Port numbers must be between 1 and 65535.
  - **Traffic type:** Select a traffic type that you want to allow or block.
    - **UNICAST:** Traffic from a single sender to a single recipient.
    - **BROADCAST:** Traffic from a single sender to all devices on the network.
    - **MULTICAST:** Traffic from one or more senders to one or more recipient.
- **LIMIT:** Select to accept connections from devices that match the criteria defined in the rule but apply limits to reduce excessive traffic.
  - **IP range:** Select to specify a range of addresses to allow or block. Use IPv4/IPv6 in **Start** and **End**.
  - **IP address:** Enter an address that you want to allow or block. Use IPv4/IPv6 or CIDR format.
  - **Protocol:** Select a network protocol (TCP, UDP, or Both) to allow or block. If you select a protocol, you must also specify a port.
  - **MAC:** Enter the MAC address of a device that you want to allow or block.
  - **Port range:** Select to specify the range of ports to allow or block. Add them in **Start** and **End**.
  - **Port:** Enter a port number that you want to allow or block. Port numbers must be between 1 and 65535.
  - **Unit:** Select the type of connections to allow or block.
  - **Period:** Select the time period related to **Amount**.
  - **Amount:** Set the maximum number of times a device is allowed to connect within the set **Period**. The maximum amount is 65535.
  - **Burst:** Enter the number of connections allowed to exceed the set **Amount** once during the set **Period**. Once the number has been reached, only the set amount during the set period is allowed.
  - **Traffic type:** Select a traffic type that you want to allow or block.
    - **UNICAST:** Traffic from a single sender to a single recipient.
    - **BROADCAST:** Traffic from a single sender to all devices on the network.

- **MULTICAST:** Traffic from one or more senders to one or more recipient.

**Test rules:** Click to test the rules that you have defined.

- **Test time in seconds:** Set a time limit for testing the rules.
- **Roll back:** Click to roll back the firewall to its previous state, before you have tested the rules.
- **Apply rules:** Click to activate the rules without testing. We don't recommend that you do this.

## Custom signed AXIS OS certificate

To install test software or other custom software from Axis on the device, you need a custom signed AXIS OS certificate. The certificate verifies that the software is approved by both the device owner and Axis. The software can only run on a specific device which is identified by its unique serial number and chip ID. Only Axis can create custom signed AXIS OS certificates, since Axis holds the key to sign them.

**Install:** Click to install the certificate. You need to install the certificate before you install the software.

The context menu contains:

- **Delete certificate:** Delete the certificate.

## Accounts

### Accounts

**Add account:** Click to add a new account. You can add up to 100 accounts.

**Account:** Enter a unique account name.

**New password:** Enter a password for the account. Passwords must be 1 to 64 characters long. Only ASCII printable characters (code 32 to 126) are allowed in the password, for example, letters, numbers, punctuation, and some symbols.

**Repeat password:** Enter the same password again.

**Privileges:**

- **Administrator:** Has full access to all settings. Administrators can also add, update, and remove other accounts.
- **Operator:** Has access to all settings except:
  - All **System** settings.
- **Viewer:** Has access to:
  - Watch and take snapshots of a video stream.
  - Watch and export recordings.
  - Pan, tilt, and zoom; with **PTZ account** access.

The context menu contains:

**Update account:** Edit the account properties.

**Delete account:** Delete the account. You can't delete the root account.

### Anonymous access

**Allow anonymous viewing:** Turn on to allow anyone access the device as a viewer without logging in with an account.

**Allow anonymous PTZ operating**  : Turn on to allow anonymous users to pan, tilt, and zoom the image.

## SSH accounts

 **Add SSH account:** Click to add a new SSH account.

- **Enable SSH:** Turn on to use SSH service.

**Account:** Enter a unique account name.

**New password:** Enter a password for the account. Passwords must be 1 to 64 characters long. Only ASCII printable characters (code 32 to 126) are allowed in the password, for example, letters, numbers, punctuation, and some symbols.

**Repeat password:** Enter the same password again.

**Comment:** Enter a comment (optional).

⋮ The context menu contains:

**Update SSH account:** Edit the account properties.

**Delete SSH account:** Delete the account. You can't delete the root account.

## Virtual host

 **Add virtual host:** Click to add a new virtual host.

**Enabled:** Select to use this virtual host.

**Server name:** Enter the name of the server. Only use numbers 0-9, letters A-Z, and hyphen (-).

**Port:** Enter the port the server is connected to.

**Type:** Select the type of authentication to use. Select between **Basic**, **Digest**, and **Open ID**.

⋮ The context menu contains:

- **Update:** Update the virtual host.
- **Delete:** Delete the virtual host.

**Disabled:** The server is disabled.

## Client Credentials Grant Configuration

**Admin claim:** Enter a value for the admin role.

**Verification URI:** Enter the web link for the API endpoint authentication.

**Operator claim:** Enter a value for the operator role.

**Require claim:** Enter the data that should be in the token.

**Viewer claim:** Enter the value for the viewer role.

**Save:** Click to save the values.

## OpenID Configuration

### Important

If you can't use OpenID to sign in, use the Digest or Basic credentials you used when you configured OpenID to sign in.

**Client ID:** Enter the OpenID username.

**Outgoing Proxy:** Enter the proxy address for the OpenID connection to use a proxy server.

**Admin claim:** Enter a value for the admin role.

**Provider URL:** Enter the web link for the API endpoint authentication. Format should be https://[insert URL]/.well-known/openid-configuration

**Operator claim:** Enter a value for the operator role.

**Require claim:** Enter the data that should be in the token.

**Viewer claim:** Enter the value for the viewer role.

**Remote user:** Enter a value to identify remote users. This assists to display the current user in the device's web interface.

**Scopes:** Optional scopes that could be part of the token.

**Client secret:** Enter the OpenID password

**Save:** Click to save the OpenID values.

**Enable OpenID:** Turn on to close current connection and allow device authentication from the provider URL.

## Events

### Rules

A rule defines the conditions that triggers the product to perform an action. The list shows all the currently configured rules in the product.

### Note

You can create up to 256 action rules.

**Add a rule:** Create a rule.

**Name:** Enter a name for the rule.

**Wait between actions:** Enter the minimum time (hh:mm:ss) that must pass between rule activations. It is useful if the rule is activated by, for example, day-night mode conditions, to avoid that small light changes during sunrise and sunset activate the rule repeatedly.

**Condition:** Select a condition from the list. A condition must be met for the device to perform an action. If multiple conditions are defined, all of them must be met to trigger the action. For information about specific conditions, see *Get started with rules for events*.

**Use this condition as a trigger:** Select to make this first condition function only as a starting trigger. It means that once the rule is activated, it remains active for as long as all the other conditions are met, no matter the state of the first condition. If you don't select this option, the rule will simply be active whenever all the conditions are met.

**Invert this condition:** Select if you want the condition to be the opposite of your selection.

**Add a condition:** Click to add an additional condition.

**Action:** Select an action from the list and enter its required information. For information about specific actions, see *Get started with rules for events*.

## Recipients

You can set up your device to notify recipients about events or send files.

### Note

If you set up your device to use FTP or SFTP, don't change or remove the unique sequence number that's added to the file names. If you do that, only one image per event can be sent.

The list shows all the recipients currently configured in the product, along with information about their configuration.

### Note

You can create up to 20 recipients.

Add a recipient: Click to add a recipient.

Name: Enter a name for the recipient.

Type: Select from the list:

- **FTP** 
  - **Host:** Enter the server's IP address or hostname. If you enter a hostname, make sure that a DNS server is specified under **System > Network > IPv4 and IPv6**.
  - **Port:** Enter the port number used by the FTP server. The default is 21.
  - **Folder:** Enter the path to the directory where you want to store files. If this directory doesn't already exist on the FTP server, you will get an error message when uploading files.
  - **Username:** Enter the username for the login.
  - **Password:** Enter the password for the login.
  - **Use temporary file name:** Select to upload files with temporary, automatically generated filenames. The files get renamed to the desired names when the upload completes. If the upload is aborted/interrupted, you don't get any corrupt files. However, you probably still get the temporary files. This way you know that all files that have the desired name are correct.
  - **Use passive FTP:** Under normal circumstances, the product simply requests the target FTP server to open the data connection. The device actively initiates both the FTP control and data connections to the target server. This is normally needed if there is a firewall between the device and the target FTP server.
- **HTTP**
  - **URL:** Enter the network address to the HTTP server and the script that will handle the request. For example, `http://192.168.254.10/cgi-bin/notify.cgi`.
  - **Username:** Enter the username for the login.
  - **Password:** Enter the password for the login.
  - **Proxy:** Turn on and enter the required information if a proxy server must be passed to connect to the HTTP server.
- **HTTPS**
  - **URL:** Enter the network address to the HTTPS server and the script that will handle the request. For example, `https://192.168.254.10/cgi-bin/notify.cgi`.
  - **Validate server certificate:** Select to validate the certificate that was created by HTTPS server.
  - **Username:** Enter the username for the login.
  - **Password:** Enter the password for the login.
  - **Proxy:** Turn on and enter the required information if a proxy server must be passed to connect to the HTTPS server.
- **Network storage** 

You can add network storage such as NAS (network-attached storage) and use it as a recipient to store files. The files are stored in the Matroska (MKV) file format.

  - **Host:** Enter the IP address or hostname for the network storage.
  - **Share:** Enter the name of the share on the host.
  - **Folder:** Enter the path to the directory where you want to store files.
  - **Username:** Enter the username for the login.
  - **Password:** Enter the password for the login.

- **SFTP** 
  - **Host:** Enter the server's IP address or hostname. If you enter a hostname, make sure that a DNS server is specified under **System > Network > IPv4 and IPv6**.
  - **Port:** Enter the port number used by the SFTP server. The default is 22.
  - **Folder:** Enter the path to the directory where you want to store files. If this directory doesn't already exist on the SFTP server, you will get an error message when uploading files.
  - **Username:** Enter the username for the login.
  - **Password:** Enter the password for the login.
  - **SSH host public key type (MD5):** Enter the fingerprint of the remote host's public key (a 32-digit hexadecimal string). The SFTP client supports SFTP servers using SSH-2 with RSA, DSA, ECDSA, and ED25519 host key types. RSA is the preferred method during negotiation, followed by ECDSA, ED25519, and DSA. Make sure to enter the right MD5 host key that is used by your SFTP server. While the Axis device supports both MD5 and SHA-256 hash keys, we recommend using SHA-256 due to stronger security over MD5. For more information on how to configure an SFTP server with an Axis device, go to the *AXIS OS Portal*.
  - **SSH host public key type (SHA256):** Enter the fingerprint of the remote host's public key (a 43-digit Base64 encoded string). The SFTP client supports SFTP servers using SSH-2 with RSA, DSA, ECDSA, and ED25519 host key types. RSA is the preferred method during negotiation, followed by ECDSA, ED25519, and DSA. Make sure to enter the right MD5 host key that is used by your SFTP server. While the Axis device supports both MD5 and SHA-256 hash keys, we recommend using SHA-256 due to stronger security over MD5. For more information on how to configure an SFTP server with an Axis device, go to the *AXIS OS Portal*.
  - **Use temporary file name:** Select to upload files with temporary, automatically generated filenames. The files get renamed to the desired names when the upload completes. If the upload is aborted or interrupted, you don't get any corrupt files. However, you probably still get the temporary files. This way, you know that all files that have the desired name are correct.
- **SIP or VMS**  :
  - SIP:** Select to make a SIP call.
  - VMS:** Select to make a VMS call.
  - **From SIP account:** Select from the list.
  - **To SIP address:** Enter the SIP address.
  - **Test:** Click to test that your call settings works.
- **Email**
  - **Send email to:** Enter the email address to send emails to. To enter multiple addresses, use commas to separate them.
  - **Send email from:** Enter the email address of the sending server.
  - **Username:** Enter the username for the mail server. Leave this field empty if the mail server does not require authentication.
  - **Password:** Enter the password for the mail server. Leave this field empty if the mail server does not require authentication.
  - **Email server (SMTP):** Enter the name of the SMTP server, for example, smtp.gmail.com, smtp.mail.yahoo.com.
  - **Port:** Enter the port number for the SMTP server, using values in the range 0-65535. The default value is 587.
  - **Encryption:** To use encryption, select either SSL or TLS.
  - **Validate server certificate:** If you use encryption, select to validate the identity of the device. The certificate can be self-signed or issued by a Certificate Authority (CA).

- **POP authentication:** Turn on to enter the name of the POP server, for example, pop.gmail.com.

**Note**

Some email providers have security filters that prevent users from receiving or viewing large amount of attachments, from receiving scheduled emails and similar. Check the email provider's security policy to avoid your email account being locked or missing out on your expected emails.

- **TCP**
  - **Host:** Enter the server's IP address or hostname. If you enter a hostname, make sure that a DNS server is specified under **System > Network > IPv4 and IPv6**.
  - **Port:** Enter the port number used to access the server.

**Test:** Click to test the setup.

The context menu contains:

**View recipient:** Click to view all the recipient details.

**Copy recipient:** Click to copy a recipient. When you copy, you can make changes to the new recipient.

**Delete recipient:** Click to delete the recipient permanently.

## Schedules

Schedules and pulses can be used as conditions in rules. The list shows all the schedules and pulses currently configured in the product, along with information about their configuration.

**Add schedule:** Click to create a schedule or pulse.

## Manual triggers

You can use the manual trigger to manually trigger a rule. The manual trigger can, for example, be used to validate actions during product installation and configuration.

## MQTT

MQTT (Message Queuing Telemetry Transport) is a standard messaging protocol for the Internet of Things (IoT). It was designed for simplified IoT integration and is used in a wide variety of industries to connect remote devices with a small code footprint and minimal network bandwidth. The MQTT client in Axis device software can simplify integration of data and events produced in the device to systems which are not video management software (VMS).

Set up the device as an MQTT client. MQTT communication is based on two entities, the clients and the broker. The clients can send and receive messages. The broker is responsible for routing messages between clients.

You can learn more about MQTT in *AXIS OS Knowledge base*.

## ALPN

ALPN is a TLS/SSL extension that allows for the selection of an application protocol during the handshake phase of the connection between the client and server. This is used to enable MQTT traffic over the same port that is used for other protocols, such as HTTP. In some cases, there might not be a dedicated port open for MQTT communication. A solution in such cases is to use ALPN to negotiate the use of MQTT as the application protocol on a standard port, allowed by the firewalls.

MQTT client

**Connect:** Turn on or off the MQTT client.

**Status:** Shows the current status of the MQTT client.

#### **Broker**

**Host:** Enter the hostname or IP address of the MQTT server.

**Protocol:** Select which protocol to use.

**Port:** Enter the port number.

- 1883 is the default value for **MQTT over TCP**
- 8883 is the default value for **MQTT over SSL**
- 80 is the default value for **MQTT over WebSocket**
- 443 is the default value for **MQTT over WebSocket Secure**

**ALPN protocol:** Enter the ALPN protocol name provided by your MQTT broker provider. This is only applicable with MQTT over SSL and MQTT over WebSocket Secure.

**Username:** Enter the username that the client will use to access the server.

**Password:** Enter a password for the username.

**Client ID:** Enter a client ID. The client identifier is sent to the server when the client connects to it.

**Clean session:** Controls the behavior at connection and disconnection time. When selected, the state information is discarded at connect and disconnect.

**HTTP proxy:** A URL with a maximum length of 255 bytes. You can leave the field empty if you don't want to use an HTTP proxy.

**HTTPS proxy:** A URL with a maximum length of 255 bytes. You can leave the field empty if you don't want to use an HTTPS proxy.

**Keep alive interval:** Enables the client to detect when the server is no longer available without having to wait for the long TCP/IP timeout.

**Timeout:** The time interval in seconds to allow a connect to complete. Default value: 60

**Device topic prefix:** Used in the default values for the topic in the connect message and LWT message on the MQTT client tab, and in the publication conditions on the **MQTT publication** tab.

**Reconnect automatically:** Specifies whether the client should reconnect automatically after a disconnect.

#### **Connect message**

Specifies if a message should be sent out when a connection is established.

**Send message:** Turn on to send messages.

**Use default:** Turn off to enter your own default message.

**Topic:** Enter the topic for the default message.

**Payload:** Enter the content for the default message.

**Retain:** Select to keep the state of client on this Topic

**QoS:** Change the QoS layer for the packet flow.

#### **Last Will and Testament message**

The Last Will Testament (LWT) lets a client provide a testament along with its credentials when connecting to the broker. If the client disconnects ungracefully at some point later (maybe because his power source died), it

can let the broker deliver a message to other clients. This LWT message has the same form as an ordinary message and gets routed via the same mechanics.

**Send message:** Turn on to send messages.

**Use default:** Turn off to enter your own default message.

**Topic:** Enter the topic for the default message.

**Payload:** Enter the content for the default message.

**Retain:** Select to keep the state of client on this Topic

**QoS:** Change the QoS layer for the packet flow.

## MQTT publication

**Use default topic prefix:** Select to use the default topic prefix, that is defined in the device topic prefix in the MQTT client tab.

**Include condition:** Select to include the topic that describes the condition in the MQTT topic.

**Include namespaces:** Select to include ONVIF topic namespaces in the MQTT topic.

**Include serial number:** Select to include the device's serial number in the MQTT payload.

**Add condition:** Click to add a condition.

**Retain:** Defines which MQTT messages are sent as retained.

- **None:** Send all messages as non-retained.
- **Property:** Send only stateful messages as retained.
- **All:** Send both stateful and stateless messages as retained.

**QoS:** Select the desired level for the MQTT publication.

## MQTT subscriptions

**Add subscription:** Click to add a new MQTT subscription.

**Subscription filter:** Enter the MQTT topic that you want to subscribe to.

**Use device topic prefix:** Add the subscription filter as prefix to the MQTT topic.

**Subscription type:**

- **Stateless:** Select to convert MQTT messages into a stateless message.
- **Stateful:** Select to convert MQTT messages into a condition. The payload is used as the state.

**QoS:** Select the desired level for the MQTT subscription.

## MQTT overlays

**Note**

Connect to an MQTT broker before you add MQTT overlay modifiers.

**Add overlay modifier:** Click to add a new overlay modifier.

**Topic filter:** Add the MQTT topic that contains the data you want to show in the overlay.

**Data field:** Specify the key for the message payload that you want to show in the overlay, assuming the message is in JSON format.

**Modifier:** Use the resulting modifier when you create the overlay.

- Modifiers that start with **#XMP** show all of the data received from the topic.
- Modifiers that start with **#XMD** show the data specified in the data field.

## Storage

### Network storage

**Network storage:** Turn on to use network storage.

**Add network storage:** Click to add a network share where you can save recordings.

- **Address:** Enter the IP address or host name of the host server, typically a NAS (network-attached storage). We recommend you to configure the host to use a fixed IP address (not DHCP since a dynamic IP address can change) or that you use DNS. Windows SMB/CIFS names are not supported.
- **Network share:** Enter the name of the shared location on the host server. Several Axis devices can use the same network share since each device gets its own folder.
- **User:** If the server requires a login, enter the username. To log in to a specific domain server, type DOMAIN\username.
- **Password:** If the server requires a login, enter the password.
- **SMB version:** Select the SMB storage protocol version to connect to the NAS. If you select **Auto**, the device tries to negotiate one of the secure versions SMB: 3.02, 3.0, or 2.1. Select 1.0 or 2.0 to connect to older NAS that don't support higher versions. You can read more about SMB support in Axis devices [here](#).
- **Add share without testing:** Select to add the network share even if an error is discovered during the connection test. The error can be, for example, that you didn't enter a password even though the server requires one.

**Remove network storage:** Click to unmount, unbind, and remove the connection to the network share. This removes all settings for the network share.

**Unbind:** Click to unbind and disconnect the network share.

**Bind:** Click to bind and connect the network share.

**Unmount:** Click to unmount the network share.

**Mount:** Click to mount the network share.

**Write protect:** Turn on to stop writing to the network share and protect recordings from being removed. You can't format a write-protected network share.

**Retention time:** Select how long to keep recordings, to limit the amount of old recordings, or to comply with regulations regarding data storage. If the network storage becomes full, old recordings are removed before the selected time period passes.

#### Tools

- **Test connection:** Test the connection to the network share.
- **Format:** Format the network share, for example, when you need to quickly erase all data. CIFS is the available file system option.

**Use tool:** Click to activate the selected tool.

#### Onboard storage

#### Important

Risk of data loss and corrupted recordings. Do not remove the SD card while the device is running. Unmount the SD card before you remove it.

**Unmount:** Click to safely remove the SD card.

**Write protect:** Turn on to stop writing to the SD card and protect recordings from being removed. You can't format a write-protected SD card.

**Autoformat:** Turn on to automatically format a newly inserted SD card. It formats the file system into ext4.

**Ignore:** Turn on to stop storing recordings on the SD card. When you ignore the SD card, the device no longer recognizes that the card exists. The setting is only available to administrators.

**Retention time:** Select how long to keep recordings to limit the amount of old recordings or comply with data storage regulations. When the SD card is full, it deletes old recordings before their retention time has passed.

#### Tools

- **Check:** Check for errors on the SD card.
- **Repair:** Repair errors in the file system.
- **Format:** Format the SD card to change the file system and erase all data. You can only format the SD card to the ext4 file system. You need a third-party ext4 driver or application to access the file system from Windows®.
- **Encrypt:** Use this tool to format the SD card and enable encryption. This erases all data stored on the SD card. Any new data you store on the SD card will be encrypted.
- **Decrypt:** Use this tool to format the SD card without encryption. This erases all data stored on the SD card. Any new data you store on the SD card will not be encrypted.
- **Change password:** Change the password required to encrypt the SD card.

**Use tool:** Click to activate the selected tool.

**Wear trigger:** Set a value for the SD card wear level at which you want to trigger an action. The wear level ranges from 0–200%. A new SD card that has never been used has a wear level of 0%. A wear level of 100% indicates that the SD card is close to its expected lifetime. When the wear-level reaches 200%, there is a high risk of the SD card malfunctioning. We recommend setting the wear trigger between 80–90%. This gives you time to download any recordings as well as replace the SD card in time before it potentially wears out. The wear trigger allows you to set up an event and get a notification when the wear level reaches your set value.

## Stream profiles

A stream profile is a group of settings that affect the video stream. You can use stream profiles in different situations, for example, when you create events and use rules to record.

Add stream profile: Click to create a new stream profile.

**Preview:** A preview of the video stream with the stream profile settings you select. The preview updates when you change the settings on the page. If your device has different view areas, you can change the view area in the drop-down in the bottom left corner of the image.

**Name:** Add a name for your profile.

**Description:** Add a description of your profile.

**Video codec:** Select the video codec that should apply for the profile.

**Resolution:** See for a description of this setting.

**Frame rate:** See for a description of this setting.

**Compression:** See for a description of this setting.

**Zipstream**  : See for a description of this setting.

**Optimize for storage**  : See for a description of this setting.

**Dynamic FPS**  : See for a description of this setting.

**Dynamic GOP**  : See for a description of this setting.

**Mirror**  : See for a description of this setting.

**GOP length**  : See for a description of this setting.

**Bitrate control:** See for a description of this setting.

**Include overlays**  : Select what type of overlays to include. See for information about how to add overlays.

**Include audio**  : See for a description of this setting.

## ONVIF

### ONVIF accounts

ONVIF (Open Network Video Interface Forum) is a global interface standard that makes it easier for end-users, integrators, consultants, and manufacturers to take advantage of the possibilities offered by network video technology. ONVIF enables interoperability between different vendor products, increased flexibility, reduced cost and future-proof systems.

When you create an ONVIF account, you automatically enable ONVIF communication. Use the account name and password for all ONVIF communication with the device. For more information see the Axis Developer Community at [axis.com](http://axis.com).

**Add accounts:** Click to add a new ONVIF account.

**Account:** Enter a unique account name.

**New password:** Enter a password for the account. Passwords must be 1 to 64 characters long. Only ASCII printable characters (code 32 to 126) are allowed in the password, for example, letters, numbers, punctuation, and some symbols.

**Repeat password:** Enter the same password again.

**Privileges:**

- **Administrator:** Has full access to all settings. Administrators can also add, update, and remove other accounts.
- **Operator:** Has access to all settings except:
  - All **System** settings.
  - Adding apps.
- **Media account:** Allows access to the video stream only.

The context menu contains:

**Update account:** Edit the account properties.

**Delete account:** Delete the account. You can't delete the root account.

## ONVIF media profiles

An ONVIF media profile consists of a set of configurations that you can use to change media stream settings. You can create new profiles with your own set of configurations or use preconfigured profiles for a quick setup.

**Add media profile:** Click to add a new ONVIF media profile.

**Profile name:** Add a name for the media profile.

**Video source:** Select the video source for your configuration.

- **Select configuration:** Select a user-defined configuration from the list. The configurations in the drop-down list correspond to the device's video channels, including multiviews, view areas and virtual channels.

**Video encoder:** Select the video encoding format for your configuration.

- **Select configuration:** Select a user-defined configuration from the list and adjust the encoding settings. The configurations in the drop-down list act as identifiers/names of the video encoder configuration. Select user 0 to 15 to apply your own settings, or select one of the default users if you want to use predefined settings for a specific encoding format.

#### Note

Enable audio in the device to get the option to select an audio source and audio encoder configuration.

**Audio source**  : Select the audio input source for your configuration.

- **Select configuration:** Select a user-defined configuration from the list and adjust the audio settings. The configurations in the drop-down list correspond to the device's audio inputs. If the device has one audio input, it's user0. If the device has several audio inputs, there will be additional users in the list.

**Audio encoder**  : Select the audio encoding format for your configuration.

- **Select configuration:** Select a user-defined configuration from the list and adjust the audio encoding settings. The configurations in the drop-down list act as identifiers/names of the audio encoder configuration.

**Audio decoder**  : Select the audio decoding format for your configuration.

- **Select configuration:** Select a user-defined configuration from the list and adjust the settings. The configurations in the drop-down list act as identifiers/names of the configuration.

**Audio output**  : Select the audio output format for your configuration.

- **Select configuration:** Select a user-defined configuration from the list and adjust the settings. The configurations in the drop-down list act as identifiers/names of the configuration.

**Metadata:** Select the metadata to include in your configuration.

- **Select configuration:** Select a user-defined configuration from the list and adjust the metadata settings. The configurations in the drop-down list act as identifiers/names of the metadata configuration.

**PTZ**  : Select the PTZ settings for your configuration.

- **Select configuration:** Select a user-defined configuration from the list and adjust the PTZ settings. The configurations in the drop-down list correspond to the device's video channels with PTZ support.

**Create:** Click to save your settings and create the profile.

**Cancel:** Click to cancel the configuration and clear all settings.

**profile\_x:** Click on the profile name to open and edit the preconfigured profile.

## Detectors

### Audio detection

These settings are available for each audio input.

**Sound level:** Adjust the sound level to a value from 0–100, where 0 is the most sensitive and 100 the least sensitive. Use the activity indicator as a guide when you set the sound level. When you create events, you can use the sound level as a condition. You can choose to trigger an action if the sound level rises above, falls below or passes the set value.

### Shock detection

**Shock detector:** Turn on to generate an alarm if the device is hit by an object or if it is tampered with.

**Sensitivity level:** Move the slider to adjust the sensitivity level at which the device should generate an alarm. A low value means that the device only generates an alarm if the hit is powerful. A high value means that the device generates an alarm even with mild tampering.

## Accessories

### I/O ports

Use digital input to connect external devices that can toggle between an open and closed circuit, for example, PIR sensors, door or window contacts, and glass break detectors.

Use digital output to connect external devices such as relays and LEDs. You can activate connected devices through the VAPIX® Application Programming Interface or the web interface.

#### Port

**Name:** Edit the text to rename the port.

**Direction:**  indicates that the port is an input port.  indicates that it's an output port. If the port is configurable, you can click the icons to change between input and output.

**Normal state:** Click  for open circuit, and  for closed circuit.

**Current state:** Shows the current state of the port. The input or output is activated when the current state is different from the normal state. An input on the device has an open circuit when it's disconnected or when there is a voltage above 1 VDC.

#### Note

During restart, the output circuit is open. When the restart is complete, the circuit goes back to the normal position. If you change any settings on this page, the output circuits go back to their normal positions regardless of any active triggers.

**Supervised**  : Turn on to make it possible to detect and trigger actions if someone tampers with the connection to digital I/O devices. In addition to detecting if an input is open or closed, you can also detect if someone has tampered with it (that is, cut or shorted). To supervise the connection requires additional hardware (end-of-line resistors) in the external I/O loop.

### Washer

**Lock nozzle position:** First, pan and tilt the camera until the nozzle is in the center of the image. Then, turn on **Lock nozzle position** to save the camera position as the washer position. When you turn it on, the washer button appears in the live view. Each time you click the washer button, the camera moves to the locked position.

**Pump time:** Set the duration of the wash spray sequence in seconds.

**Wiper time:** Set the duration of the wiper sequence in seconds.

**Pump connection:** Select the washer pump pin that the washer is connected to. Go to **System > Accessories > I/O ports** and check that the selected pin is configured as an output.

## External illuminators

**Illuminator 1:** Click to select a light type for the first illuminator.

**Illuminator 2:** Click to select a light type for the second illuminator.

## Logs

### Reports and logs

#### Reports

- **View the device server report:** View information about the product status in a pop-up window. The Access Log is automatically included in the Server Report.
- **Download the device server report:** It creates a .zip file that contains a complete server report text file in UTF-8 format, as well as a snapshot of the current live view image. Always include the server report .zip file when you contact support.
- **Download the crash report:** Download an archive with detailed information about the server's status. The crash report contains information that is in the server report as well as detailed debug information. This report might contain sensitive information such as network traces. It can take several minutes to generate the report.

#### Logs

- **View the system log:** Click to show information about system events such as device startup, warnings, and critical messages.
- **View the access log:** Click to show all failed attempts to access the device, for example, when a wrong login password is used.
- **View the audit log:** Click to show information about user and system activities, for example, successful or failed authentications and configurations.

### Remote system log

Syslog is a standard for message logging. It allows separation of the software that generates messages, the system that stores them, and the software that reports and analyzes them. Each message is labeled with a facility code, which indicates the software type generating the message, and assigned a severity level.

**Server:** Click to add a new server.

**Host:** Enter the hostname or IP address of the server.

**Format:** Select which syslog message format to use.

- Axis
- RFC 3164
- RFC 5424

**Protocol:** Select the protocol to use:

- UDP (Default port is 514)
- TCP (Default port is 601)
- TLS (Default port is 6514)

**Port:** Edit the port number to use a different port.

**Severity:** Select which messages to send when triggered.

**Type:** Select the type of logs you want to send.

**Test server setup:** Send a test message to all servers before you save the settings.

**CA certificate set:** See the current settings or add a certificate.

## **Plain config**

Plain config is for advanced users with experience of Axis device configuration. Most parameters can be set and edited from this page.

## Maintenance

### Maintenance

**Restart:** Restart the device. This does not affect any of the current settings. Running applications restart automatically.

**Restore:** Return most settings to the factory default values. Afterwards you must reconfigure the device and apps, reinstall any apps that didn't come preinstalled, and recreate any events and presets.

#### Important

The only settings saved after restore are:

- Boot protocol (DHCP or static)
- Static IP address
- Default router
- Subnet mask
- 802.1X settings
- O3C settings
- DNS server IP address

**Factory default:** Return all settings to the factory default values. Afterwards you must reset the IP address to make the device accessible.

#### Note

All Axis device software is digitally signed to ensure that you only install verified software on your device. This further increases the overall minimum cybersecurity level of Axis devices. For more information, see the white paper "Axis Edge Vault" at [axis.com](https://axis.com).

**AXIS OS upgrade:** Upgrade to a new AXIS OS version. New releases can contain improved functionality, bug fixes, and completely new features. We recommend you to always use the latest AXIS OS release. To download the latest release, go to [axis.com/support](https://axis.com/support).

When you upgrade, you can choose between three options:

- **Standard upgrade:** Upgrade to the new AXIS OS version.
- **Factory default:** Upgrade and return all settings to the factory default values. When you choose this option, you can't revert to the previous AXIS OS version after the upgrade.
- **Automatic rollback:** Upgrade and confirm the upgrade within the set time. If you don't confirm, the device reverts to the previous AXIS OS version.

**AXIS OS rollback:** Revert to the previously installed AXIS OS version.

## Troubleshoot

**Reset PTR**  : Reset PTR if for some reason the **Pan**, **Tilt**, or **Roll** settings aren't working as expected. The PTR motors are always calibrated in a new camera. But calibration can be lost, for example, if the camera loses power or if the motors are moved by hand. When you reset PTR, the camera is re-calibrated and returns to its factory default position.

**Calibration**  : Click **Calibrate** to recalibrate the pan, tilt, and roll motors to their default positions.

**Ping**: To check if the device can reach a specific address, enter the hostname or IP address of the host you want to ping and click **Start**.

**Port check**: To verify connectivity from the device to a specific IP address and TCP/UDP port, enter the hostname or IP address and port number you want to check and click **Start**.

### Network trace

#### Important

A network trace file might contain sensitive information such as certificates or passwords.

A network trace file can help you troubleshoot problems by recording activity on the network.

**Trace time**: Select the duration of the trace in seconds or minutes and click **Download**.

## **Learn more**

### **Color palettes**

To help the human eye distinguish details in a thermal image, you can apply a color palette to the image. The colors in the palette are artificially created pseudocolors that emphasize temperature differences.

### **Privacy masks**

#### **Note**

Privacy masks are only available for the visual channel.

A privacy mask is a user-defined area that prevents users from viewing a part of the monitored area. In the video stream, privacy masks appear as blocks of solid color.

You'll see the privacy mask on all snapshots, recorded video, and live streams.

You can use the VAPIX® application programming interface (API) to hide the privacy masks.

#### **Important**

If you use multiple privacy masks it may affect the product's performance.

You can create several privacy masks. Each mask can have 3 to 10 anchor points.

### **Overlays**

Overlays are superimposed over the video stream. They are used to provide extra information during recordings, such as a timestamp, or during product installation and configuration. You can add either text or an image.

### **Pan, tilt, and zoom (PTZ)**

#### **Guard tours**

A guard tour displays the video stream from different preset positions either in a predetermined or random order, and for configurable periods of time. Once started, a guard tour continues to run until stopped, even when there are no clients (web browsers) viewing the images.

### **Streaming and storage**

#### **Video compression formats**

Decide which compression method to use based on your viewing requirements, and on the properties of your network. The available options are:

##### **Motion JPEG**

Motion JPEG, or MJPEG, is a digital video sequence that is made up of a series of individual JPEG images. These images are then displayed and updated at a rate sufficient to create a stream that shows constantly updated motion. For the viewer to perceive motion video the rate must be at least 16 image frames per second. Full motion video is perceived at 30 (NTSC) or 25 (PAL) frames per second.

The Motion JPEG stream uses considerable amounts of bandwidth, but provides excellent image quality and access to every image contained in the stream.

##### **H.264 or MPEG-4 Part 10/AVC**

#### **Note**

H.264 is a licensed technology. The Axis product includes one H.264 viewing client license. To install additional unlicensed copies of the client is prohibited. To purchase additional licenses, contact your Axis reseller.

H.264 can, without compromising image quality, reduce the size of a digital video file by more than 80% compared to the Motion JPEG format and by as much as 50% compared to older MPEG formats. This means that less network bandwidth and storage space are required for a video file. Or seen another way, higher video quality can be achieved for a given bitrate.

### H.265 or MPEG-H Part 2/HEVC

H.265 can, without compromising image quality, reduce the size of a digital video file by more than 25% compared to H.264.

#### Note

- H.265 is licensed technology. The Axis product includes one H.265 viewing client license. Installing additional unlicensed copies of the client is prohibited. To purchase additional licenses, contact your Axis reseller.
- Most web browsers don't support H.265 decoding and because of this the camera doesn't support it in its web interface. Instead you can use a video management system or application supporting H.265 decoding.

### How do Image, Stream, and Stream profile settings relate to each other?

The **Image** tab contains camera settings that affect all video streams from the product. If you change something in this tab, it immediately affects all video streams and recordings.

The **Stream** tab contains settings for video streams. You get these settings if you request a video stream from the product and don't specify for example resolution, or frame rate. When you change the settings in the **Stream** tab, it doesn't affect ongoing streams, but it will take effect when you start a new stream.

The **Stream profiles** settings override the settings from the **Stream** tab. If you request a stream with a specific stream profile, the stream contains the settings of that profile. If you request a stream without specifying a stream profile, or request a stream profile that doesn't exist in the product, the stream contains the settings from the **Stream** tab.

### Bitrate control

Bitrate control helps you to manage the bandwidth consumption of your video stream.

#### Variable bitrate (VBR)

Variable bitrate allows the bandwidth consumption to vary depending on the level of activity in the scene. The more activity, the more bandwidth you need. With variable bitrate you are guaranteed constant image quality, but you need to make sure you have storage margins.

#### Maximum bitrate (MBR)

Maximum bitrate lets you set a target bitrate to handle bitrate limitations in your system. You might see a decline in image quality or frame rate as the instantaneous bitrate is kept below the specified target bitrate. You can choose to prioritize either image quality or frame rate. We recommend that you configure the target bitrate to a higher value than the expected bitrate. This gives you a margin in case there is a high level of activity in the scene.

## Analytics and apps

With analytics and apps you can get more out of your Axis device. AXIS Camera Application Platform (ACAP) is an open platform that makes it possible for third parties to develop analytics and other apps for Axis devices. Apps can be preinstalled on the device, available for download for free, or for a license fee.

To find the user manuals for Axis analytics and apps, go to [help.axis.com](http://help.axis.com).

## Cybersecurity

For product-specific information about cybersecurity, see the product's datasheet at [axis.com](http://axis.com).

For in-depth information about cybersecurity in AXIS OS, read the *AXIS OS Hardening guide*.

## Axis Edge Vault

Axis Edge Vault provides a hardware-based cybersecurity platform that safeguards the Axis device. It offers features to guarantee the device's identity and integrity and to protect your sensitive information from unauthorized access. It builds on a strong foundation of cryptographic computing modules (secure element and TPM) and SoC security (TEE and secure boot), combined with expertise in edge device security.

## Signed OS

Signed OS is implemented by the software vendor signing the AXIS OS image with a private key. When the signature is attached to the operating system, the device will validate the software before installing it. If the device detects that the integrity of the software is compromised, the AXIS OS upgrade will be rejected.

## Secure boot

Secure boot is a boot process that consists of an unbroken chain of cryptographically validated software, starting in immutable memory (boot ROM). Being based on the use of signed OS, secure boot ensures that a device can boot only with authorized software.

## Secure keystore

A tamper-protected environment for the protection of private keys and secure execution of cryptographic operations. It prevents unauthorized access and malicious extraction in the event of a security breach. Depending on security requirements, an Axis device can have either one or multiple hardware-based cryptographic computing modules, which provide a hardware-protected secure keystore. Depending on security requirements, an Axis device can have either one or multiple hardware-based cryptographic computing modules, like a TPM 2.0 (Trusted Platform Module) or a secure element, and/or a TEE (Trusted Execution Environment), which provide a hardware-protected secure keystore. Furthermore, selected Axis products feature a FIPS 140-2 Level 2-certified secure keystore.

### **Axis device ID**

Being able to verify the origin of the device is key to establishing trust in the device identity. During production, devices with Axis Edge Vault are assigned a unique, factory-provisioned, and IEEE 802.1AR-compliant Axis device ID certificate. This works like a passport to prove the origin of the device. The device ID is securely and permanently stored in the secure keystore as a certificate signed by Axis root certificate. The device ID can be leveraged by the customer's IT infrastructure for automated secure device onboarding and secure device identification

### **Signed video**

Signed video ensures that video evidence can be verified as untampered without proving the chain of custody of the video file. Each camera uses its unique video signing key, which is securely stored in the secure keystore, to add a signature into the video stream. When the video is played, the file player shows whether the video is intact. Signed video makes it possible to trace the video back to the camera origin and verifies that the video has not been tampered with after it left the camera.

### **Encrypted file system**

The secure keystore prevents the malicious exfiltration of information and prevents configuration tampering by enforcing strong encryption upon the file system. This ensures no data stored in the file system can be extracted or tampered with when the device is not in use, unauthenticated access to the device is achieved and/or the Axis device is stolen. During the secure boot process, the read-write filesystem is decrypted and can be mounted and used by the Axis device.

To learn more about the cybersecurity features in Axis devices, go to [axis.com/learning/white-papers](https://axis.com/learning/white-papers) and search for cybersecurity.

### **Axis security notification service**

Axis provides a notification service with information about vulnerability and other security related matters for Axis devices. To receive notifications, you can subscribe at [axis.com/security-notification-service](https://axis.com/security-notification-service).

### **Vulnerability management**

To minimize customers' risk of exposure, Axis, as a **Common Vulnerability and Exposures (CVE) numbering authority (CNA)**, follows industry standards to manage and respond to discovered vulnerabilities in our devices, software, and services. For more information about Axis vulnerability management policy, how to report vulnerabilities, already disclosed vulnerabilities, and corresponding security advisories, see [axis.com/vulnerability-management](https://axis.com/vulnerability-management).

### **Secure operation of Axis devices**

Axis devices with factory default settings are pre-configured with secure default protection mechanisms. We recommend using more security configuration when installing the device. To learn more about Axis' approach to cybersecurity, including best practices, resources, and guidelines for securing your devices, go to [axis.com/about-axis/cybersecurity](https://axis.com/about-axis/cybersecurity).

## Specifications

### Product overview

- 1 Weathershield
- 2 Top cover
- 3 Inner cover
- 4 Positioning unit
- 5 Base unit screws
- 6 Base unit
- 7 Wiper
- 8 Front with protective foil
- 9 Visual lens
- 10 Thermal lens
- 11 Lid

- 1 Top cover connector
- 2 RS485 connector
- 3 Power connector
- 4 Control button
- 5 RJ45 connector
- 6 Status LED
- 7 Audio IN 3.5 mm connector
- 8 SD card slot (microSD, card not included)
- 9 Input power connector
- 10 I/O connector
- 11 RJ45 connector
- 12 SFP slot for SFP module (not included)

**LED indicators**

Status LED	Indication
Unlit	Normal operation
Green	Steady during startup
Amber	Steady during startup. Flashes during firmware upgrade or reset to factory default.
Amber/Red	Flashes amber/red if network connection is unavailable or lost.
Red	Firmware upgrade failure.

## SD card slot

### ⚠ CAUTION

⚠ Moving parts. Risk of injury. Keep your body parts away from the product when it's in operation. Disconnect from power supply before installing or performing maintenance on the product.

### ⚠ CAUTION

⚠ Hot surface. Risk of injury. Don't touch the product when it's in operation. Disconnect from power supply and allow the surfaces to cool before performing maintenance on the product.

### NOTICE

- Risk of damage to SD card. Don't use sharp tools, metal objects, or excessive force when inserting or removing the SD card. Use your fingers to insert and remove the card.
- Risk of data loss and corrupted recordings. Unmount the SD card from the device's web interface before removing it. Don't remove the SD card while the product is running.

This device supports microSD/microSDHC/microSDXC cards.

For SD card recommendations, see [axis.com](http://axis.com).

microSD, microSDHC, and microSDXC Logos are trademarks of SD-3C LLC. microSD, microSDHC, microSDXC are trademarks or registered trademarks of SD-3C, LLC in the United States, other countries or both.

## Insert an SD card

You can use an SD card to store recordings locally in the device. The SD card is not included.

### ⚠ CAUTION

- ⚠ Risk of injury. Moving parts. Keep your body parts away from the device when in operation. Disconnect from power supply before installing or performing maintenance on the device.
- ⚠ Risk of injury. Hot surface. Do not touch the device when in operation. Disconnect from power supply and allow the surfaces to cool before performing maintenance on the device.

### NOTICE

When you remove the top cover you expose parts of the camera that are sensitive to impact. Make sure you don't hit the unprotected camera with the top cover when you remove it.

To insert an SD card in the device:

1. Disconnect power from the device.

2. Loosen the four top cover screws and remove the top cover.
3. Insert the SD card. To find out where the SD card slot is placed, see .

4. Put back the top cover and tighten the screws (torque 2.0 Nm).
5. Reconnect power to the device.

## Buttons

### Control button

The control button is used for:

- Resetting the product to factory default settings. See .

## Connectors

### Network connector

RJ45 Ethernet connector.

SFP connector.

### Audio connector

- **Audio in** – 3.5 mm input for a mono microphone, or a line-in mono signal (left channel is used from a stereo signal).
- **Audio in** – 3.5 mm input for a digital microphone, an analog mono microphone, or a line-in mono signal (left channel is used from a stereo signal).

Audio input

1 Tip	2 Ring	3 Sleeve
Digital signal	Ring power if selected	Ground

### I/O connector

Use the I/O connector with external devices in combination with, for example, motion detection, event triggering, and alarm notifications. In addition to the 0 VDC reference point and power (12 V DC output), the I/O connector provides the interface to:

**Digital input** – For connecting devices that can toggle between an open and closed circuit, for example PIR sensors, door/window contacts, and glass break detectors.

**Digital output** – For connecting external devices such as relays and LEDs. Connected devices can be activated by the VAPIX® Application Programming Interface, through an event or from the device's web interface.

Function	Pin	Notes	Specifications
DC ground	1		0 VDC
DC output	2	 <p>Can be used to power auxiliary equipment. Note: This pin can only be used as power out.</p>	<p>12 VDC Max load = 50 mA</p>

Configurable (Input or Output)	3–6	Digital input – Connect to pin 1 to activate, or leave floating (unconnected) to deactivate.	0 to max 30 VDC
		Digital output – Internally connected to pin 1 (DC ground) when active, and floating (unconnected) when inactive. If used with an inductive load, e.g., a relay, connect a diode in parallel with the load, to protect against voltage transients.	0 to max 30 VDC, open drain, 100 mA

Example:

Power connector

4-pin terminal block for power input.

24 V AC/DC power connector

NOTICE

This section is valid for products powered by 24 V AC and 24 V DC only.

This table is only valid for the 24 V AC and the 24 V DC power connectors.

Position	24 V AC	24 V DC
1	Protective earth	Protective earth
2	24 V AC Phase	+ 24 V
3	24 V AC Neutral	0 V
4	Not connected	Not connected

Illuminator connectors

	Position	Cable color (positioning unit)	Cable color (illuminators)	Description
IL1	1	Red	Red	+24V IL
	2	Black	Orange	IL1 +VE
	3	Gray	Purple	IL1 -VE
	4	Blue	Black	GND
IL2	5	Yellow	Red	+24V IL
	6	Orange	Orange	IL2 +VE
	7	White	Purple	IL2 -VE
	8	Green	Black	GND

## Clean your device

### **NOTICE**

- Avoid cleaning in direct sunlight or elevated temperatures, since this can cause stains.
1. To avoid stains, dry the device with a clean, nonabrasive cloth.

## Troubleshooting

### Reset to factory default settings

#### ⚠ CAUTION

- ⚠ Risk of injury. Moving parts. Keep your body parts away from the product when in operation. Disconnect from power supply before installing or performing maintenance on the product.
- ⚠ Risk of injury. Hot surface. Do not touch the product when in operation. Disconnect from power supply and allow the surfaces to cool before performing maintenance on the product.

#### NOTICE

When you remove the top cover you expose parts of the visual camera that are sensitive to impact. Make sure you don't hit the unprotected camera with the top cover when you remove it.

#### Important

Reset to factory default should be used with caution. A reset to factory default resets all settings, including the IP address, to the factory default values.

#### Note

The installation and management software tools are available from the support pages at [axis.com/support/downloads](https://axis.com/support/downloads)

1. Disconnect power from the product.

2. Loosen the four top cover screws and remove the top cover.
3. Press the control button. To find out where the control button is placed, see
4. Put back the top cover and tighten the screws (torque 2.0 Nm).
5. Reconnect power to the product.

You can also reset to factory default through the product's web page. Go to **Settings > System > Maintenance** and click **Default**.

### AXIS OS options

Axis offers device software management according to either the active track or the long-term support (LTS) tracks. Being on the active track means continuously getting access to all the latest product features, while the LTS tracks provide a fixed platform with periodic releases focused mainly on bug fixes and security updates.

Using AXIS OS from the active track is recommended if you want to access the newest features, or if you use Axis end-to-end system offerings. The LTS tracks are recommended if you use third-party integrations, which are not continuously validated against the latest active track. With LTS, the products can maintain cybersecurity

without introducing any significant functional changes or affecting any existing integrations. For more detailed information about Axis device software strategy, go to [axis.com/support/device-software](https://axis.com/support/device-software).

## Check the current AXIS OS version

AXIS OS determines the functionality of our devices. When you troubleshoot a problem, we recommend that you to start by checking the current AXIS OS version. The latest version might contain a correction that fixes your particular problem.

To check the current AXIS OS version:

1. Go to the device's web interface > **Status**.
2. Under **Device info**, see the AXIS OS version.

## Upgrade AXIS OS

### Important

- When you upgrade the device software, your preconfigured and customized settings are saved. Axis Communications AB can't guarantee that the settings are saved, even if the features are available in the new AXIS OS version.
- Starting from AXIS OS 12.6, you must install every LTS version between your device's current version and the target version. For example, if the currently installed device software version is AXIS OS 11.2, you have to install the LTS version AXIS OS 11.11 before you can upgrade the device to AXIS OS 12.6. For more information, see *AXIS OS Portal: Upgrade path*.
- Make sure the device remains connected to the power source throughout the upgrade process.

### Note

- When you upgrade the device with the latest AXIS OS version in the active track, the product receives the latest functionality available. Always read the upgrade instructions and release notes available with each new release before you upgrade. To find the latest AXIS OS version and the release notes, go to [axis.com/support/device-software](https://axis.com/support/device-software).
1. Download the AXIS OS file to your computer, available free of charge at [axis.com/support/device-software](https://axis.com/support/device-software).
  2. Log in to the device as an administrator.
  3. Go to **Maintenance > AXIS OS upgrade** and click **Upgrade**.

When the upgrade has finished, the product restarts automatically.

## Technical problems and possible solutions

### Problems upgrading AXIS OS

#### AXIS OS upgrade failed

If the upgrade fails, the device reloads the previous version. The most common reason is that the wrong AXIS OS file has been uploaded. Check that the name of the AXIS OS file corresponds to your device and try again.

#### Problems after AXIS OS upgrade

If you experience problems after the upgrade, roll back to the previously installed version from the **Maintenance** page.

### Problems setting the IP address

#### Can't set the IP address

- If the IP address intended for the device and the IP address of the computer used to access the device are located on different subnets, you can't set the IP address. Contact your network administrator to obtain an IP address.
- The IP address could be in use by another device. To check:
  1. Disconnect the Axis device from the network.
  2. In a Command/DOS window, type `ping` and the IP address of the device.
  3. If you receive: `Reply from <IP address>: bytes=32; time=10...` this means that the IP address might already be in use by another device on the network. Obtain a new IP address from the network administrator and reinstall the device.
  4. If you receive: `Request timed out`, this means that the IP address is available for use with the Axis device. Check all cabling and reinstall the device.
- There could be a possible IP address conflict with another device on the same subnet. The static IP address in the Axis device is used before the DHCP server sets a dynamic address. This means that if the same default static IP address is also used by another device, there could be problems accessing the device.

#### Problems accessing the device

##### Can't log in when accessing the device from a browser

When HTTPS is enabled, make sure that you use the correct protocol (HTTP or HTTPS) when you try to log in. You might need to manually type `http` or `https` in the browser's address field.

If you've lost the password for the root account, you must reset the device to the factory default settings. For instructions, see .

##### The IP address has been changed by DHCP

IP addresses obtained from a DHCP server are dynamic and could change. If the IP address has been changed, use AXIS IP Utility or AXIS Device Manager to locate the device on the network. Identify the device using its model or serial number, or by the DNS name (if the name has been configured).

If required, you can assign a static IP address manually. For instructions, go to [axis.com/support](http://axis.com/support).

##### Certificate error when using IEEE 802.1X

For authentication to work properly, the date and time settings in the Axis device must be synchronized with an NTP server. Go to **System > Date and time**.

##### The browser isn't supported

For a list of recommended browsers, see .

##### Can't access the device externally

To access the device externally, we recommend you to use one of the following applications for Windows®:

- AXIS Camera Station Edge: free of charge, ideal for small systems with basic surveillance needs.
- AXIS Camera Station Pro: 90-day trial version free of charge, ideal for small to mid-size systems.

For instructions and download, go to [axis.com/vms](http://axis.com/vms).

## Problems with MQTT

### Can't connect over port 8883 with MQTT over SSL

The firewall blocks traffic that uses port 8883 since it's regarded insecure.

In some cases the server/broker might not provide a specific port for MQTT communication. It might still be possible to use MQTT over a port normally used for HTTP/HTTPS traffic.

- If the server/broker supports WebSocket/WebSocket Secure (WS/WSS), typically on port 443, use this protocol instead. Check with the server/broker provider to see if WS/WSS is supported and which port and basepath to use.
- If the server/broker supports ALPN, the use of MQTT can be negotiated over an open port, such as 443. Check with your server/broker provider to see if ALPN is supported and which ALPN protocol and port to use.

If you can't find what you're looking for here, try the troubleshooting section at [axis.com/support](https://axis.com/support).

## Performance considerations

When you set up your system, it's important to consider how different settings and situations affect performance. Some factors affect bandwidth (bitrate), others affect frame rate, and some affect both.

The most important factors to consider:

- High image resolution or lower compression levels result in images containing more data which in turn affects the bandwidth.
- Rotating the image in the GUI can increase the product's CPU load.
- Access by large numbers of Motion JPEG clients or unicast H.264/H.265/AV1 clients affects the bandwidth.
- Simultaneous viewing of different streams (resolution, compression) by different clients affects both frame rate and bandwidth.  
Use identical streams wherever possible to maintain a high frame rate. Stream profiles can be used to ensure that streams are identical.
- Accessing video streams with different codecs simultaneously affects both frame rate and bandwidth. For optimal performance, use streams with the same codec.
- Heavy usage of event settings affects the product's CPU load which in turn affects the frame rate.
- Using HTTPS may reduce frame rate, in particular if streaming Motion JPEG.
- Heavy network utilization due to poor infrastructure affects the bandwidth.
- Viewing on poorly performing client computers lowers perceived performance and affects frame rate.
- Running multiple AXIS Camera Application Platform (ACAP) applications simultaneously may affect the frame rate and the general performance.
- Running multiple AXIS Camera Application Platform (ACAP) applications on the Visual and Thermal channels simultaneously may affect the frame rate and the general performance.

## Contact support

If you need more help, go to [axis.com/support](https://axis.com/support).
